PART 1. INTRODUCTION TO PROGRAMMING

1.1 PROGRAMMING OVERVIEW

The OfficeServ 7100 system arrives from the factory with default data. Connect it to trunks, stations and power, turn the system on and it is fully operational. The only thing left to do is customize the data to fit the customer's needs. This is called programming the system.

MMC stands for Man Machine Code and each program is assigned a different three digit code. These MMC codes are used to view, create or change customer data. Programming is simply deciding what needs to be done and knowing which MMC is used to do it. For example, use MMC 601 to create a station group. System speed dial numbers are entered in MMC 705 and soft keys are assigned to individual keysets using MMC 722.

System programming may be done from any two line display keyset. The first thing you must do is open system programming. As a security measure, a passcode must be known to do this.

• iDCS KEYSETS

This diagram illustrates the keys on a **iDCS 28 BUTTON** and a **iDCS 18 BUTTON keyset** that have special functions during programming. When required, these keys will be referred to by the names described in the diagram.

This diagram illustrates the keys on a **iDCS 8 BUTTON keyset** that have special functions during programming. When required, these keys will be referred to by the names described in the diagram.

• **ITP-5121D KEYSETS and DS 5000 Series KEYSETS**

This diagram illustrates the keys on **ITP 5121-D, DS 5021D, DS 5014D and DS 5007S keysets** that have special functions during programming. When required, these keys will be referred to by the names described in the diagram.

1.2 PROGRAMMING LEVELS

There are three levels of programming: SYSTEM, CUSTOMER and STATION. System and customer levels are under passcode protection while station programming does not require a passcode.

To prevent conflicting data from being entered, only one person at a time can enter programming with the technician or customer passcode. While programming is in progress, normal system operation is not affected. For your convenience, the system displays [xxx IN PGM MODE] when another keyset is in the program mode.

A. System level

This level is entered via MMC 800 and requires the technician level passcode. It allows access to all system programs, station programs and maintenance programs.

B. Customer level

This level is entered via MMC 200 and requires the customer passcode. It allows access to station programs and system programs allowed by the technician in MMC 802. When using the customer passcode to access station programs, data for all stations can be viewed or changed.

NOTE: When the system is programmed for multiple tenant use, each tenant has an individual customer passcode enabled in MMC 201. The access for tenant passcode is limited to only certain MMCs. [See MMC 201 for more details.](#)

After opening programming with the customer passcode, you must press TRSF to exit. Now press TRSF and the MMC number you wish to access.

C. Station level

All keysets can access station programs 102–117 without using a passcode. Each user can only change station data for his/her own keyset.

When the LCD 24B keyset is in programming, the display shows instructions, prompts and choices. Existing data is always displayed before it can be changed. The keystroke sequence for each MMC is detailed in the following pages.

Before you begin entering customer data, follow this important reminder.

D. Remote Programming

The OfficeServ 7100 also provides a proprietary application called Installation Tool (IS Tool). This application can be loaded onto any high performance PC (that meets the minimum requirements) and it is used only to program the telephone system from anywhere in the world, provided there is a LAN/WAN or modem connection.

This permits technicians to program the phone system, modify the customer database or download (save) the entire customer database to a file. This file can be saved as a back up and can be uploaded when required to restore the database. The IS Tool can also be used to view the customer database offline, and to send new loads of software upgrades to the MMC+ of a live system.

1.3 SYSTEM MEMORY MANAGEMENT

In **previous** OfficeServ Systems such as the OfficeServ 100, 500, and 7200, SRAM memory stored the active system database and Smart Media was where the Database was saved on a more permanent basis. The SRAM was battery-backed on the MCP card by a super-capacitor with a battery backup switch which could clear the memory and default the system. However, the memory architecture of the OfficeServ 7100 is different.

The OS7100 has 4 types of memory:

- 1) **SRAM (2MB):** Holds information such as Call Logs, Alarms, UCD call stats, program logs and traffic reports. SRAM is backed by the Super Capacitor on the MP10. If the switch is ON, data can last up to 1 day without main system power.
- 2) **DRAM:** This is where active system Database resides. During IS Tool or KMMC programming, the data being programmed is written to DRAM.

DRAM IS CLEARED WHEN SYSTEM BOOTS. During system boot up, the latest SRAM contents are reloaded into DRAM.

- 3) **MMC+ (256MB):** When you use MMC 815 and save the Database to MMC+, it copies the active Database from DRAM and saves it to MMC+ Card. This way the most up-to-date database is saved to MMC+ Card.

WHAT THIS MEANS TO YOU?

From the information described above, you can see that if you made a programming change in KMMC and pressed the right soft key to save, the change is made immediately to DRAM and the change takes effect immediately. Likewise, if you make a programming change using IS Tool and click the SAVE button, the change is effective immediately and is saved to DRAM active system database.

1.4 DEFAULTING THE SYSTEM

You can default the system by turning the MP10 battery backup switch OFF for at least 30 seconds and then ON again. Turning the battery backup switch OF then ON again will simply clear the SRAM. You can also default the OS 7100 by going to MMC 811 MEMORY CLEAR (however mmc 830 IP address information will be retained).

IMPORTANT REMINDER

When first installing this system, always use MMC 811 to reset and clear memory. This will ensure that you begin with clean default data.

Now begin entering customer data

PART 2. PROGRAM PROCEDURES

2.1 OVERVIEW

THE FOLLOWING INSTRUCTIONS FOR EACH MMC ASSUME THAT YOU HAVE ALREADY OPENED PROGRAMMING.

HELPFUL HINT:

When you are finished programming in MMC codes 100–855 and have other programming to do, press **SPEAKER** to exit the MMC but stay in the programming mode and use one of the following methods.

1. Dial another MMC code directly and continue programming.
2. Press **VOLUME UP** and **DOWN** keys to scroll through all MMC codes. When the desired MMC code is reached, press **SPEAKER** and continue programming.

Pressing **TRANSFER** will always save changes and exit the programming mode.

MMC: 100

STATION LOCK

DESCRIPTION:

Allows the system administrator or technician to lock or unlock an individual station or all stations simultaneously. The three options are as follows:

- | | | |
|---|------------------|---|
| 0 | UNLOCKED | Unlocks a locked station. |
| 1 | LOCKED OUTGOING | The keyset cannot make calls outside the system. It can however make and receive intercom calls and receive incoming C.O. calls. When in this mode the HOLD key of an iDCS, DS or ITP keyset will flash slow RED. |
| 2 | LOCKED ALL CALLS | The keyset cannot make or receive any calls. When in this mode the HOLD key of an iDCS, DS or ITP keyset will light steady RED. |

PROGRAM KEYS

DEFAULT DATA: ALL STATIONS UNLOCKED

RELATED ITEMS: [STATION USER PROGRAMMING](#)

MMC: 101 CHANGE USER PASSCODE

DESCRIPTION:

Allows the system administrator or technician to reset any keyset's passcode to its default value of "1234." This MMC cannot display station passcodes; it can only reset them to default.

Keyset users can set or change their individual passcodes. The passcode is used to lock or unlock the keyset for toll restriction (call barring) override and to access the DISA feature.

NOTE: Default passcodes cannot be used for toll restriction override or for DISA access.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

MMC: 102

CALL FORWARD

DESCRIPTION:

Allows the system administrator to program the call forward destinations for other station users. This MMC also allows call forward to be set after the destination has been entered.

The OfficeServ 7100 system allows five types of call forwarding: FORWARD ALL, FORWARD NO ANSWER, FORWARD BUSY, FORWARD FOLLOW ME and FORWARD DND. There is an additional option, FORWARD BUSY/NO ANSWER, that allows both of these options to be activated at the same time, provided that destinations have been entered for both. Destinations for forward types 1, 2, 3 and 5 can be internal or external numbers.

0 = FORWARD CANCEL
1 = ALL CALL
2 = BUSY

3 = NO ANSWER
4 = BUSY/NO ANSWER
5 = FORWARD DND

0 = FORWARD CANCEL

This option will cancel any call forwarding set in MMC 102. It will not remove the programmed destination and will not override any preset forward settings in MMC 316.

1 = FORWARD ALL

This option, when set, will forward all calls to the programmed destination. If the programmed destination is a station then that station can call the forwarded station to put calls through.

2 = BUSY

This option, when set, will forward calls to the programmed destination when the forwarded keyset is busy.

3 = NO ANSWER

This option, when set, will forward calls to the programmed destination if the forwarded station does not answer a call before the forward no answer timer in MMC 502 expires.

4 = BUSY/NO ANSWER

This option will activate both the BUSY option and the NO ANSWER option at the same time.

5 = FWD DND

This option will forward all calls to the programmed destination whenever the forwarded station goes into DND.

SET ANSWER MODE

DESCRIPTION:

Allows the system administrator to change the answer mode of any keyset. Each keyset can have its answer mode set to one of the following options:

0. RING: The keyset will ring in one of eight custom ring patterns. Calls are answered by pressing the ANS/RLS key or by lifting the handset.
1. AUTO: After giving a short attention tone, the keyset will automatically answer calls on the speakerphone. When a C.O. line is transferred to a keyset in Auto Answer, the screened portion of the call will be Auto Answer, but the keyset will ring when the transfer is complete if the user has not pressed the ANS/RLS key or lifted the handset.
2. VOICE: The keyset will not ring. After a short attention tone, callers can make an announcement but the ANS/RLS key or handset must be used to answer calls.

STATION SPEED DIAL

DESCRIPTION:

Allows the system administrator or technician to program the personal speed dial locations assigned to a station. This must be done for single line telephones because these stations cannot access programming. Each station may have up to 50 locations or bins assigned to it in MMC 606 Assign Speed Block. The speed dial bins are numbered 00~49 (or 000~049 if the SYSTEM SPEED BIN MAX = 950 in MMC 861). Each speed dial number consists of a trunk or trunk group access code followed by a separator and up to 24 digits to be dialed. These dialed digits may consist of 0~9, * and #. If the system recognizes a valid trunk or trunk group access number, it will automatically insert the separator.

PROGRAM KEYS

UP & DOWN	Used to scroll through options

MMC: 106 STATION SPEED DIAL NAME

DESCRIPTION:

Allows an 11-character name to be entered for each personal speed dial location. This name enables the speed dial number to be located when the directory dial feature is used. The directory dial feature allows the display keyset user to select a speed dial location by viewing its name.

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial keypad as the previous character, press the UP key to move the cursor to the right.

• iDCS, DS and ITP KEYSETS

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0

MMC: 110**STATION ON/OFF****DESCRIPTION:**

Allows the system administrator to set any of the keyset features listed below.

FEATURES		DESCRIPTION
00	AUTO HOLD	Automatically places an existing C.O. call on hold if a CALL button, trunk key or trunk route key is pressed during that call.
01	AUTO TIMER	Automatically starts the stopwatch timer during a C.O. call.
02	HEADSET USE	When ON, this feature disables the hookswitch allowing a headset user to answer all calls by pressing the ANS/RLS button.
03	HOT KEYPAD	When ON, this feature allows the user to dial directory numbers without having to first lift the handset or press the SPEAKER button.
04	KEY TONE	Allows the user to hear a slight tone when pressing buttons on keyset.
05	PAGE REJOIN	Allows the user to hear the latter part of page announcements if keyset becomes free during a page.
06	RING PREF.	When OFF, requires the user to press the fast flashing button to answer a ringing call after lifting the handset.
07	NOT FOR USA	This field is reserved and can not be used for U.S. software.
08	AUTO CAMP-ON	Keyset users can allow intercom calls to camp-on to other keysets without having to press a CAMP-ON key.
09	NOT FOR USA	
10	AME PASSCODE	If this option is set to YES, station users who have AME set must enter their station password to listen to messages being left.
11	DISP SPD NAME	If this option is set to ON the user will have the name associated with the speed dial number shown in the display after the number has been dialed.

MMC: 110

FEATURES		DESCRIPTION
12	CID REVIEW ALL	If this setting is set to OFF the CID review list will only store CID information for calls that were not answered at the station and reject the information for calls that were answered. When set to ON all calls will be stored in the list.
13	SECURE OHVA	When set to OFF an OHVA will be heard through the keyset speaker rather than the handset.
14	NOT FOR USA	
15	AUTO ANS CO	When set to ON CO lines programmed to ring that keyset directly will auto answer if the keyset is programmed for auto answer in MMC 103 .
16	ENBLOCK 2LCD	<i>For ITP Phones with 2 Line Display</i> Set to ON will require user to press SEND button to make a call, it works like a cell phone. Enblock dialing must be enabled in MMC 861 .
17	STN NO RING	When ON all incoming calls will not ring at stations.

ALARM CLOCK

DESCRIPTION:

Allows the system administrator or technician to set or change the alarm clock/appointment reminder feature for any analog station. This must be done for single line telephones, as they cannot access programming. Three alarms may be set for each station and each alarm may be defined as a one-time or TODAY alarm or as a DAILY alarm, as described below. The TODAY alarm is automatically cancelled after it rings, while the DAILY alarm rings every day at the same time. Alarm numbers are 1, 2 and 3. In the case of Secondary Pair assignments (MMC 217) the alarm only rings the station that is programmed and does not ring the paired station.

Entry	Alarm Type
Dial 0	NOTSET
Dial 1	TODAY
Dial 2	DAILY

ALARM REMINDER

DESCRIPTION:

Allows the system administrator or technician to set or change the alarm clock/appointment reminder feature for any digital station. This must be done for single line telephones because they cannot access programming. Three alarms may be set for each station and each alarm may be defined as a one-time or TODAY alarm or as a DAILY alarm, as described below. The TODAY alarm is automatically cancelled after it rings, while the DAILY alarm rings every day at the same time. It is also possible to set a message to display when the alarm is sounded.

ENTRY	ALARM TYPE
DIAL 0	NOTSET
DIAL 1	TODAY
DIAL 2	DAILY

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

TEXT MESSAGE

DESCRIPTION:

This program allows the user to create or modify 16 character text messages for their personal use in response to an off-hook voice announcement (OHVA). Only the stations set to use text messaging in MMC 611 can create and use text messages. Each station can have up to 10 text messages.

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

CONFERENCE GROUP

DESCRIPTION:

This program defines the conference groups. Only 5012 ITP keysets and OfficeServ Softphone users that are set to use conference groups in Program 612 can access this MMC. One station can have up to 5 conference groups. The maximum number of members for one conference group will be 4, excluding the station itself.

In this MMC you assign each conference group a name, and then enter up to four members in each group. You can build up to 5 groups.

Conference group names are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

EXECUTIVE PRESENT STATE

DESCRIPTION:

When inter-working with EASYSET, the state of executive stations can be displayed. This program sets the present state of executive that the user wants to show. Also, this program allows the executive/secretary function so the user can set the answer mode for when an executive calls up.

Allows the system administrator or technician to change the status of an executive station.

Note: You must assign BOSS/SECRETARY stations using MMC 303 before programming this MMC.

1. EXEC STATE: The text message programmed here is displayed when inter networking with Easyset.
2. STATE (IN): Easyset displays the message programmed here if EXEC STATE is set to "OTHERS (IN)" in item 1 above.
3. STATE (OUT): Easyset displays the message programmed here if EXEC STATE is set to "OTHERS (OUT)" in item 1 above.
4. ANS MODE: When a secretary calls executive station using the BOSS key; the executive station according to the settings for this option.

Status messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

MMC: 202 CHANGE FEATURE PASSCODE

DESCRIPTION:

Used to change the passcodes for the following features: RING PLAN, DISA ALARM, ALARM CLR, AA RECORD, DELETE, and WLI REGIST.

DIAL	OPTION	DESCRIPTION
0	RING PLAN	This is the passcode required to place the system in different ring plans (RP) or change the ring time override (RTO).
1	DISA ALARM	This is the passcode required to clear a DISA ALARM generated when the number of DISA attempts are exceeded.
2	ALARM CLR	This is the passcode required to clear an alarm sensor.
3	AA RECORD	NOT USED. This item will be removed in the future from the OfficeServ 7100 software.
4	DELETE	Hotel / Motel feature passcode, required to delete entries from a guest or meeting room bill (NOT USED IN THE USA).
5	WLAN	This is the passcode to allow mobile stations to register to the WLI card.

NOTE: The passcode is four digits long. Each digit can be 0-9.

MMC: 210 CUSTOMER ON/OFF PER TENANT

DESCRIPTION:

Allows the system administrator to set in system features on a per-tenant basis. Each system option has a corresponding dialing number, as listed below. All options toggle ON/OFF.

00 DISA PSWD :ON	When this option is set to ON a caller must enter a 7 digit DISA password when they call a DISA trunk. When it is set to OFF a passcode is not required and the caller has full access to all features allowed on this trunk.
01 LCR ENABLE :OFF	This option determines whether the system will or will not route outgoing calls based on the information in the LCR routing tables contained in MMC's 710, 711, 712 and 713. LCR access code must be assigned in Dial Numbering Plan (MMC 724). System default is NO.
03 PERI UCD RPT :OFF	<p>When this option is turned ON a UCD report for each UCD group is printed periodically for an external display panel. The format of the print out is ASCII format. The format is as follows: ~0=1=2=3=4=5=6=7=8=9\n\d</p> <ul style="list-style-type: none">~: smdi header=: delimiter0: UCD group number (1-4 digits)1: total answered call count (0=99999)2: unanswered call count (0-99999)3: all agents busy count (0-99999)4: average ring time (0-99999 in seconds)5: average call time (0-99999 in seconds)6: total all busy (0-99999 in seconds)7: current queue count (0-99999)8: longest queue time (0-99999 in seconds)9: average queue time (0-99999 in seconds)\n: new line\d: carriage return
04 CID CODE INSERT:ON	When this option is ON the system will insert the digit "1" when receiving CID information. When OFF the digit "1" will not be inserted in the CID information. This option is tenant wide. In certain areas the central offices are using a 10 digit numbering plan for calls. This feature can reduce the number of LCR digit table inputs in those areas that use the CID display callback feature. System default is ON.

MMC: 210

05 DISA MOH :OFF	When this option is turned ON outside parties will hear trunk MOH instead of dial tone from the time the system answers a DISA trunk until the caller dials a digit. System default is OFF.
06 TRANSFER MOH :OFF	When this option is turned ON outside parties will hear trunk MOH instead of ring back tone from the time a transfer is completed until the call is answered by an internal party. System default is OFF.
08 DID BSY ROUT :OFF	When this option is turned on a DID call directed to a busy station will reroute to the operator if camp on is set to OFF in MMC 714. If the option is set to ON the call will re route to the destination in MMC 406 for that trunk.
09 ALARM MOH: OFF	When ON allows stations to hear MOH after answering an alarm reminder call.
13 RECALL PICKUP :ON	When this option is turned on a call recalling to a station can be picked up using Direct Call Pickup, Pickup Group and My Group features. This applies to held calls recalling and transferred calls recalling to a station.
14: ICM EXT FWD :OFF	When this option is on call forward external is allowed when intercom calls are placed to a station that has Call Forward External programmed and set.
16: DID ERR TONE :OFF	This option was added to provide error tone when an invalid DID number is received. The OfficeServ 7100 error tone should not be sent to the public network in the USA.
24 TRSF CANCEL :OFF	When turned OFF a single line phone will be able to handle 2 calls simultaneously. Using the hook-flash to toggle between them. When turned ON a single line telephone will be able to connect to the 2 nd call, but pressing the h/f will not toggle between the two calls it will disconnect the 2 nd call and reconnect the single line telephone to the first call.
32 ISDN PROGCON:OFF	This option, when ON, determines if the system will wait for an answer signal before allowing DTMF to be sent on an ISDN circuit.
36 DSS KEY DPU :OFF	When set to ON, the station can make a directed call pickup, by pressing the flashing DSS key of the ringing station.
37 BEGN DGT DSP :ON	When ON and an outside call is made via speed dial or LNR where more than 11 digits are dialed, then only the first 11 digits dialed are shown on the keyphone display. When OFF, the last 11 digits are displayed.

MMC: 210

38 ONE TCH FACC: ON	When ON, then a station may enter an account code using a one touch account code (ACC) key. When OFF, then a station must enter an account code by dialing via dial-pad before making an outside call.
39 SGR ALL OUT :ON	This option, when on, allows all members to log out of a station group.
40 CHAIN FWD :ON	When ON and a call is directed to a station that may be forwarded to another station that is call forwarded to a VMAA, then the caller will be directed to the last station's mailbox it reached. When OFF, then the caller will be directed to the first station's mailbox instead of the last.
41 TRK MONITER :ON	When set to ON, a barging party maintains the trunk connection, when the barged station goes on hook. When set to OFF, and the barged station goes on hook, all parties are disconnected.
42 VoIP MFRALOC :OFF	When set to ON, a DTMF receiver is assigned for VoIP tandem calling when a VoIP incoming trunk is connected to a VoIP outgoing trunk. Note: Except when H.245 signal mode is being used.
43 NTWK AUTOTMR:OFF	This option controls whether an intercom call across the network link will have the auto timer come on when the call is received.
46 PERI UCD SIO:OFF	When this option is set to ON the PERI UCD date is sent to the UCD port type of SIO port service, instead of the PERI UCD port type.
48 REDIAL REVW:OFF	When set to ON, this option will allow the user to review the last number dialed before dialing.
53 PRE FWD BUSY:OFF	When set to ON this option makes the preset forward no answer setting in MMC 316 act as forward on BUSY/NO ANSWER.
54 ORG DIAL LOG:ON	When this option is set to ON all digits dialed from a phone will be saved in the log.
56 VOIP REALRBT:OFF	If this option is set to ON the MGI channels will provide the ringback tones.
57 CO-CO TM ALL:OFF	NOT USED IN USA.
SMDR LOG ALL: OFF	NOT USED IN USA
NO ITEM COST: OFF	NOT USED IN USA

MMC: 210

58 SMDR AUT2 ACC:OFF	When using authorization codes over 4 digits (maximum 10) set this option to ON and the authorization code will print in the Account Code field of SMDR. When set to OFF only the first four digits of any authorization code will appear in the AUTH field of SMDR.
59 IPNW REAL RB:OFF	When set to OFF the Ring Back tone on network calls will be generated from the originating MCP card. When set to ON, the distant MCP card provides both Ring Back tone on network calls.
60 TRK AUTO MOH:OFF	Turn this option ON to have the system immediately answer an incoming call and play the AA (Auto Answer) source set in MMC 408.
61 TRSF VT KEY:ON	Turn this ON to make the TRANSFER key act like a VT key. It will buffer digits dialed then send to Voice Mail after hanging up. Example: While on a call press TRANSFER, dial the Voice Mail Group number, then mailbox number, then hang up. OFF = normal TRANSFER key operation.
62 PAIR NO RING:OFF	When set to OFF a call to a busy station paired with another will ring at the paired station. Turn this ON and a call to a busy station paired with another will not ring at the paired station.
63 DISA NO ACT:OFF	Turn this ON to disconnect a caller to the DISA line when they take no action before the DISA NO ACTION TIME in MMC 501.
64 ICM AUTO HOLD:OFF	Set this option to ON to have intercom calls follow AUTO HOLD ON/OFF option in MMC 110.
65 DTMF to SO: OFF	NOT USED IN THE USA
66 STN HOLD PICK: OFF	If ON intercom calls that are on HOLD can be picked up by other stations.
67 AREA DELETE	NOT USED IN THE USA.
68 ELCR DIAL TONE: OFF	NOT USED IN THE USA.

MMC: 219 TRAFFIC REPORT PRINTOUT

DESCRIPTION:

This MMC is used to print a traffic report and select options. The traffic report can be printed upon demand, every hour, at a programmed time of each day, or up to three separate timed shifts. Automatic printing will always clear the totals.

When MANUAL PRINTOUT is selected, the options are:

- PRINT AND CLEAR: A report is printed and all totals are reset to 0.
- PRINTOUT ONLY: A report is printed and all the totals are saved.
- CANCEL PRINTOUT: The program can be exited here if no report is needed.

When AUTO PRINT OPTN is selected, the options are:

- AUTO PRINT OFF: Reports are not automatically printed.
- DAILY HHMM:2359 A report is printed at this programmable time every day and all the totals are reset to "0."
- EVERY HOUR MM:00 A Traffic report will be printed every hour at this time
- THREE TIME SHIFT: Up to three separate Start and End times may be programmed to report traffic within certain times of a day. A report is printed at the end of each End time and all totals are reset to "0."

When a report is printed, the totals represent call statistics accumulated from the date of the last report stated as BEGINNING: D & T up to the date of this printout stated as ENDING D & T. See the sample report at the end of this MMC.

If there are no trunks in a group, the trunk group report for that group will not print.

PROGRAM KEYS

This MMC programming sequence is designed to be used by the end user and does not require the usual programming key strokes.

ACTION

1. Press TRANSFER 219

AUDIO PROMPT

DESCRIPTION:

This MMC is designed to enhance the Wake Up feature. The system will play a recorded Prompt when a Wake Up call is answered by the user. The Wake Up Announcement feature will require that the embedded voicemail access the customized Wake Up Prompt (001-9999) that has been recorded on the embedded voicemail as a Prompt. The end user will record this Prompt and have the ability to change it when desired using the TUI System Administrator or GUI Voice Studio. The Wake Up PMT will have no default Prompt assigned to it.

This feature offers a busy overflow destination. In the event that the AA group is busy, the guest would receive MOH upon answering the wake up call.

This MMC has three options:

Option	Description
AA GROUP (STATION GROUP)	Determines which station group will be connected when a Wake Up call is answered. This destination must be any station group assigned as "VMSUCD".
MESSAGE NO (PROMPT NO.)	Determines which message will be played when a Wake Up call is answered. This destination can be a custom recorded message. (Message #1000~9999)*
GROUP BUSY	Determines which tone source will be connected when AA group members are all busy. This destination can be a NONE, TONE or extern music on hold. If NONE is set then dial tone is connected, if TONE is set then hold tone is connected.
RBT SOURCE	NOT USED IN USA.

* Message #5049~5064 have pre-recorded Auto Attendant (AA) default messages programmed and can be over-written. Do not use this range of messages for Wake-Up messages if you want to preserve the AA messages.

MMC: 300 CUSTOMER ON/OFF PER STATION

DESCRIPTION:

Allows the following features to be enabled on a per-station basis.

ACCESS DIAL	Determines whether a user can select a trunk or trunk group by dialling its directory number (DN). This selection should be turned to off when using LCR.
MICROPHONE	This option allows or denies the use of a keyset's microphone if equipped.
OFF-HOOK RING	Will allow a short burst of ring tone to indicate another call.
SMDR PRINT	When the station is set for no C.O. calls to and from this station, the station will not print on SMDR. This includes transferred calls or calls picked up from hold or park.
TGR ADV.TONE	When this feature is set to ON, a warning tone will be heard each time LCR advances to the next route.
VMAA FORWARD	This feature selects whether C.O. calls can be forwarded to voice mail. ON = Permits forward to voice mail. OFF = No forward to voice mail.
INTRCOM SMDR	When the station is set to OFF, the station will not print intercom calls on SMDR.
FWD OVRD	When set to OFF intercom calls from this station will not follow the call forwarding of the called station.
RECL TO OPER	This option determines if a transferred call will recall to the transferring station (OFF) or to the operator (ON).
SLT LP OPEN	This option only applies to single line ports. When this option is set to ON the SLT port will receive a Loop Open Disconnect if the calling or called party hangs up before the SLT. This option does not affect ports set as DATA or VMAA in MMC 207/208, these ports will always receive a disconnect regardless of this setting.

MMC: 300

- CID TO SLT:** System provides Caller ID to SLT.
- NO RCL FLASH:** If ON and an SLT hook flashes and does not dial and hangs up, then the call will disconnect. If OFF the call will recall. The same applies if a keyset transfers and hangs up without dialling a station. Typically not used in the US market.
- RBK STN NAME:** If ON, the called station's name is displayed while ringing (Intercom calls only).

MMC: 315 CUSTOMER SET RELOCATION

DESCRIPTION:

Customer Set Relocation allows System Administration level or Technician level access to relocate or exchange similar stations in the OfficeServ 500 without wiring changes (see Allow Table below). This program is a one for one exchange with like stations. All individual station assignments such as trunk ring, station group, station COS, station speed dial, button appearances, etc. will follow the Customer Set Relocation program. iDCS 18 button keysets and iDCS 28 button keysets can be exchanged. Add On Modules and 64 button modules can also be exchanged. If incompatible set types are selected the system will provide an ERROR: NO MATCH message. If AOM or 64 button module units are to be exchanged the Master assignment must be removed prior to using Customer Set relocation. If the AOM or 64 button module Master station is not removed the error code ERROR: NOT ALONE will appear on the LCD display. A station must be in the idle state (on hook) to perform Customer Set Relocation. If a wired location has a station port connected but no telephone instrument the Customer Set Relocation program will allow set relocation as long as the station types are similar.

iDCS 18 button and iDCS 28 button key assignments should be taken in consideration when relocating these types of sets due to the button configurations of the instruments. If a 18 button set and a 28 button set are exchanged using the Customer Set Relocation program the first 18 buttons on the 24 button set will have the button programming of the 18 button set. In other words, when exchanging 18 and 28 button set only the first 18 buttons will swapped.

NOTE: Customer access to this feature is default OFF in MMC 802.

PRESET FWD NO ANSWER

DESCRIPTION:

Allows a technician to assign a default destination for FNA to each station on the system. These destinations may be different for each station or they may be the same. The preset destination will be temporarily overwritten if the station user enters a different FNA destination. If the user cancels the new destination, the preset destination will once more be in effect. If a station user has a FNA key, the LED will not indicate Preset Forward No Answer. Preset Forward No Answer time follows the station forward no answer timer. There is also an option (OPT) to select whether the forward applies to internal calls (I), outside calls (O) or both (BOTH).

Notes: This destination must be internal to the system. External numbers cannot be programmed. You must set PRE FWD BUSY to ON in MMC 210 for this feature to work.

MMC: 317 TIME/COST DISPLAY OPTION

DESCRIPTION:

This MMC determines if a display keyset will show the duration of the call in progress or the cost of the call in progress. Each station can set this option for either TIMER or COST.

TIMER: The duration of the call in progress will show in the upper right corner of the keyset display. The duration is in minutes and seconds. The cost of the call will not be shown.

COST: The cost of the call in progress will show in the upper right corner of the keyset display. The cost of the call is in dollars and cents. The duration of the call will not be shown.

This MMC cannot be selected by the station user. It must be set by using either the technician or customer passcode.

MMC: 400 CUSTOMER ON/OFF PER TRUNK

DESCRIPTION:

Assigns several options (listed below) on a per-trunk basis.

OPTIONS

0	1A2 EMULATE	When this option is set to ON up to 4 internal stations can participate in a conversation on this trunk by pressing the trunk key.
1	TRK INC. DND	When this option is set to ON a trunk that is programmed to ring a specific station (a private line or DIL) will ring at that station if the station is in DND.
2	TRK FORWARD	When this option is set to OFF this trunk will not follow a ringing stations call forwarding.
3	EFWD EXT CLI	Uses station CID when forwarding external C.O. lines.
4	REPEAT CLI	When set to ON the CLI information sent out of this system on a tandem trunk call will be the CLI information received on the incoming segment of the tandem call. When OFF the CLI sent out of this system on a tandem trunk call will be generated by this system.
5	TONECHK DISC	When this is set to ON, loop trunks can be disconnected by detecting busy tone (LP TRK TONE DISC must be ENABLE in MMC 861 for this feature to work).
6	AUTO ANSWER	When ON, auto answer mode can be assigned on a per-trunk basis.
7	COLORRING AS	NOT USED IN USA.

TRUNK NAME

DESCRIPTION:

Allows an 11-character name to be entered to identify an individual trunk.

Names are written using the keypad. Each press of a key selects a character. Press the desired key to move the cursor to the next position. For example, if the directory name is SAM SMITH, press the number 7 three times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing the A key changes the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move the cursor left. A space can be entered by using these keys.

MMC: 408 ASSIGN TRUNK MOH SOURCE

DESCRIPTION:

Allows the system administrator to set MOH tone for each trunk in the system.

Option 1: MOH—this selects the Music On Hold source will be heard on each trunk when it is put on hold.

Option 2: AA—this selects which Music On Hold or tone source will be heard when the trunk is automatically answered by the system. See [MMC 210](#)-Trunk Auto MOH, ON/OFF. This feature must be set to ON before the AA option will take effect.

For the three types of selection for Options 1 and 2 see below.

OPTIONS

1. TONE: An intermittent tone is played to the caller.
2. NONE: No Music on Hold selection.
3. 371: MOH is played from External Source connected to MISC port.

MMC: 410

ASSIGN DISA TRUNK

DESCRIPTION:

Allows the system the ability to have Direct Inward System Access (DISA). Because there is a possibility that unauthorized calls will be made via this feature, several safeguards have been added. The end user must be informed of these to prevent unnecessary service calls. DISA can lockout when a predetermined number of invalid consecutive calls are attempted. Callers will then receive error tone until the programmable timer has expired. The * key may be used to initiate new dial tone while in a station to station call. The # key may be used to terminate the DISA call and disconnect the central office line. DISA lines must be assigned to the Ring Plan(s).

MMC: 414 ASSIGN CALLER ID / ANI TRUNKS

DESCRIPTION:

Allows the system administrator or technician to activate Caller ID or ANI on a per-trunk basis. Activating Caller ID or ANI will delay the incoming ring indication at the operator by two ring cycles to allow for the collection of the calling party data.

Each trunk has the following options:

- | | | |
|---|-----------|--------------------------------|
| 0 | NORMAL | This is not a Caller ID trunk. |
| 1 | CID TRUNK | This is a Caller ID trunk. |
| 2 | ANI TRUNK | This is an ANI trunk. |

NOTE: ANI information can be received only on digital trunks. [T1 not supported on the 7100]
ANI is programmed for use on a trunk group basis.

MMC: 419

DISTINCTIVE RINGING

DESCRIPTION:

Allows the technician to assign the ring tone be sent by the calling station or trunk to the called (receiving) station. There is also a cadence control option to perform a similar function for single line sets. There are eight ring tones available for the phones. There are 5 cadences for SLT's.

It also allows the technician to assign the call priority for a group call when called by a specific station or when a specific trunk rings that phone. When calls into station group come and group members are all busy, the system will assign a priority to a specific station or a specific station or a specific trunk so that calls from a high priority call will be placed at the front of the group queue. If this option is set to NO, the longest call that placed at the group queue has the highest priority. There are 9 priority levels: priority 1 is the highest and priority 9 is the lowest.

TONE OPTION	DESCRIPTION
NO	Calls will ring with the digital phone users choice of ring frequency.
1~8	Calls from the programmed station or trunk will ring phones with this ring frequency.

CADENCE OPTION	DESCRIPTION
NO	Calls will ring with the normal SLT ring cadences.
1	Calls from the programmed station or trunk will ring SLT's with the intercom ring cadence.
2	Calls from the programmed station or trunk will ring SLT's with the CO ring cadence.
3	Calls from the programmed station or trunk will ring SLT's with the DOOR ring cadence.
4	Calls from the programmed station or trunk will ring SLT's with the ALARM ring cadence.
5	Calls from the programmed station or trunk will ring SLT's with the CALLBACK ring cadence.

ANI / DNIS OPTIONS

DESCRIPTION:

Provides a flexible means of setting in band digits to allow ANI (Automatic Number Identification) and DNIS (Dialed Number Identification Service) when used in conjunction with each other. These settings are defined on a per trunk group basis. The inband signaling string is as follows: Separator 1 (if used), DN1, Separator 2 (if used), DN2 and Separator 3 (if used). DN1 and DN2 fields must be flagged for either DNIS or ANI and the number of digits to be expected. ANI service is supported by digital T1 E&M tie line service only [T1 NOT SUPPORTED ON OS7100]. The two digit call ID can be set as any two digits by selecting "AA" in the separator field. If additional wink signaling is to be received the separator "CC" should be used. "CC" allows for a wink that is not more than 400ms. Call digit strings and separators depend on the service provider. If "NONE" is set as a separator a 700ms delay or pause is allowed between the ANI fields. ANI is assigned on a trunk group basis.

Note: AA = Don't care
CC = Wink 400 ms max.
NONE = 700ms pause max. (expect no digits)

The following options may be selected for ANI / DNIS operation:

1. Separator 1 This indicates the start of an ANI type call. Valid inputs include 0 to 9, *, # 2 digit call I.D. (0 to 9, *,#, AA) or NONE.
2. DN1 Select ANI or DNIS use.
3. Number of digits Select the number of digits to received. DNIS= 1-7, ANI= 1-10
4. Separator 2 This is the separator between the ANI or DNIS digits. Valid inputs include 0 to 9, *, #, 2 digit call I.D. (0 to 9, *,#, AA) CC or NONE.
5. DN2 Select ANI or DNIS use.
6. Number of digits Select the number of digits to be received.

MMC: 420

7. Separator 3

This separator indicates the close of digits being sent on an ANI / DNIS call. Valid inputs include 0 to 9, *, #, CC or NONE.

COST RATE

DESCRIPTION:

In this MMC, the TRUNK COST RATE flags are entered for each trunk. The per trunk cost rates are defined in MMC 729 Rate Calculation Table. The dialed digits Costing Plans are defined in MMC 730. Each trunk may be defined with up to eight cost rates. Enter one or more of the eight COST RATES per trunk. If an entry is left blank, no call costing will be calculated for that particular DIAL PLAN.

Call type 8 is fixed for incoming. Apply a cost rate under type 8 only to a trunk if you want incoming call costing.

MMC: 430

PRI CONTROL

DESCRIPTION:

This MMC allows the technician to program a TEPRI or TEPRIa trunk card, which has been designated as a PRI. The normal mode of operation for a PRI facility in the US is DID (i.e., shown as DDI in this MMC) service for incoming calls and senderized operation (i.e., the switch provides dial tone, collects the called number digits, and then places the call) for outgoing calls. The only useful mode of operation for a U.S. PRI is the DDI (i.e., DID) mode. Further, the default Timer settings are appropriate for the U.S. and should not be changed unless you are instructed to do so by the Samsung Product and/or Technical Support Departments.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

OPTION TABLE

ANY CHANNEL:

YES = Preferred channel selection (i.e., another idle channel may be used for this call if this channel is initially selected);

NO = Exclusive channel selection (i.e., only this channel may be used) for this call if this channel is initially selected)

PRI MODE: DDI = the only valid U.S. selection (U.S. DID mode); NORMAL = don't use in the U.S.A.

CH. SELECT:

HIGH = hunt for a channel from the highest numbered channel to the lowest when making an outgoing call;

LOW = hunt for a channel from the lowest numbered channel to the highest when making an outgoing call

SWH:

The ISDN protocol you wish to run (e.g., NI_2, 5ESS10, DMS100, NI_1, Bellcore 5ESS5, 5ESS9)

MMC: 430

USE CHANNEL: the number of provisioned ISDN “B” channels on the PRI (range: 1-23)

TIMER: ISDN T200 and T300 series timer values (note: do not change these since defaults are correct for U.S. operation)

CLI TABLE: This refers to the table 1-4 in MMC 321 that will be used for Calling party number (the CLI that is sent).

CONNECTION STATUS

DESCRIPTION:

This read only MMC will confirm the connection status of stations or trunks. Display status actually displays the status of a station or trunk at the time requested. If a conference is in progress with the selected trunk or station the display will show one of the conference parties and an arrow (→). The technician or system administrator can then display the next parties in the conference. If a station or trunk is in an idle state the display will show "NONE". If the station or trunk selected is not a valid selection the display will show "INVALID DATA". If the station or trunk is made busy by the CPU the display will show "MADE BUSY". If the station is in busy state with no other connection, the display will show "BUSY" only.

PROGRAM KEYS

SYSTEM-WIDE COUNTERS

DESCRIPTION:

Used to set the values of the system counters. The counters are listed below with a brief description of each.

- | | |
|---------------------|---|
| 0 ALARM REM. CNTER | The number of times that an alarm reminder will ring a station before cancelling. RANGE = 1-99. (Also used for wake up calls). |
| 1 AUTO RDL COUNTER | The number of times the system will redial an outside number after the auto redial feature has been activated. RANGE = 1-99. |
| 2 DISA CALL CNTER | Sets the maximum number of intercom calls that can be made after accessing a DISA line. RANGE = 1-99. |
| 3 DISA LOCK CNTER | Number of attempts the system will allow to incorrectly access a DISA line before locking out the DISA line. RANGE = 1-99 |
| 4 NEW CALL COUNTER | Number of times the system will allow a user to signal New Call on a C.O. line during one call. RANGE = 1-99. |
| 5 UCDS VISUAL ALARM | Used to set the Visual alarm threshold. It is triggered when the number of calls waiting to be answered in the UCD group reaches this value. The SP key will flash when this number of calls is queued to the UCD group. RANGE = 0-25. |
| 6 UCDS AUDIO ALARM | Used to set the Audio alarm threshold. It is triggered when the number of calls waiting to be answered in the UCD group reaches this value. The SP key will flash and the phone will ring when this number of calls is queued to the UCD group. RANGE = 0-25. |
| 7 UCD CS LEVEL 1 | Provides call wait indication level 1 if number of calls waiting to be answered in UCD group reaches this value. CS keys will flash amber when this number of calls is queued to the UCD group. RANGE = 0-25. |

MMC: 500

- 8 UCD CS LEVEL 2 Provides call wait indication level 2 if number of calls waiting to be answered in UCD group reaches this value. CS keys will flash amber when this number of calls is queued to the UCD group. RANGE = 0-25.

TIMER DESCRIPTIONS

ALARM TIMER	This is the time the system alarm key will start ringing after the alarm key has been silenced.
ALERT TONE TIME	This timer sets the duration of the attention tone preceding a call to a keyset in the Voice Announce or Auto Answer mode. This tone will also precede a forced Auto Answer call.
ALM REM INTERVAL	This timer controls the time length between ring attempts at a station when alarm reminder is set. (Also used for wake-up calls).
ALM REM RING OFF	This timer controls the length of the ring cycle duration when alarm reminder is set at a station. (Also used for wake-up calls).
ATT RECALL TIME	This is the length of time a transfer recall (hold or transfer) will ring at an idle station before recalling the operator.
AUTO REDIAL INT	This timer controls the time between attempts after RETRY dialing is set on a station.
AUTO REDIAL RLS	This timer controls the duration of a Ring No Answer condition on a retry number dialed before the auto redial is automatically canceled.

MMC: 501

CALLBACK NO ANS	This timer controls the time before the callback is automatically canceled when a callback detects Ring No Answer.
CAMP ON RECALL	This timer controls the duration of time a camped-on call will stay at a destination before recalling to the transferring station.
CID MSG RECEIVE	The amount of time that the system will allow a valid message from the C.O.
CID DISPLAY TIME	The amount of time that the Caller ID information remains on the keyset's display.
C.O.-C.O. DISCONNECT	This timer monitors the duration of an unsupervised conference; when it expires, both trunks are disconnected.
CONFIRM TONE TIME	The tone heard when a feature is activated or deactivated.
CRD TONE INT TM	This is the call record tone interval time. An entry other than zero will cause a tone to be heard by all the parties in a recorded conversation. The range for the tone is 001 (every second) to 255 (every 255 seconds). A value of 000 means no tone.
DIAL PASS TIME	This timer monitors the duration of time before connecting the transmit of the keyset to the trunk side of an outgoing call.
DISA DISCONNECT	This timer controls the maximum duration of a DISA call.
DISA DTMF DETECT	This timer sets the time duration that DTMF can be received on a DISA line.
DISA LOCK OUT TIMER	This timer controls the duration of time a DISA call is not allowed to be made after the DISA error counter has expired (MMC 500).
DISA NOANS DISC.	(NOT USED IN THE USA)
DISA PASS CHECK	This timer defines the time period before the system clears the incorrect passcode counter.
DISA NO ACTION	(NOT USED IN THE USA)

MMC: 501

DISPLAY DELAY TIMER	This timer controls the duration a display is shown in the LCD display. This timer also controls the duration of time that error tone is heard.
DOOR LOCK RELEASE	This timer controls the duration of time the door lock relay will be activated.
DOOR RING DETECT	This timer controls the duration of time before a call is answered by the door phone.
DOOR RING OFF TM	This timer controls the duration of ringing at the door ring destination before automatically canceling.
E-HOLD RECALL TM	This timer controls the duration of time a call is held exclusively at a station before recalling.
FIRST DIGIT TIME	This timer controls how long the system will wait for dialing to begin before dropping the dial tone and returning the user to error tone.
HOK FLASH MAX TM	This timer monitors the duration of a hookswitch flash to ensure that the flash is valid and not a line noise or an accidental hookswitch bounce (LONGEST DURATION).
HOK FLASH MIN TM	This timer monitors the duration of a hookswitch flash to ensure that the flash is valid and not a line noise or an accidental hookswitch bounce (SHORTEST DURATION).
HOOK OFF TIME	This timer controls the time before dial tone is sent to a single line station.
HOOK ON TIME	This timer sets the minimum amount of time that the system will recognize as an SLT hang up.
INQUIRY RELEASE	This timer monitors the duration of the interaction of the soft key to determine when to return the LCD back to a normal status. This timer affects only display phones.
INTER DIGIT TIME	This timer controls the grace period between dialing valid digits before dropping the call and returning the user back to error tone.
ISDN INTERDIGIT TIMER	This timer controls the grace period between dialing valid digits and the end of the dialing string on an ISDN call.

MMC: 501

KMMC LOCKOUT TIMER	This timer controls the grace period between programming actions while in a programming session. The timer automatically returns the system to secure programming status.
LCR ADVANCE TIME	This timer controls the duration of time before selecting the next allowable route when a station is allowed to route advance.
LCR INTER DIGIT	This timer controls the grace period between dialing valid digits before accessing a trunk.
LONG KEY DETECT	This timer controls the time a key must be held down before the key press is repeated.
LONG KEY REPEAT	This timer controls the time between repeated digits on a long key press.
MS LED ON TIME	This timer controls the duration a Manual Signalling key will remain on after use.
OFF HOOK RING INTERVAL	This timer controls the duration of time between ring bursts to a user who has a camped-on call.
OHVA ANSWER TIME	This timer controls the time duration of an OHVA call before automatic rejection.
PAGE TIME OUT	This timer controls the duration of a page announcement.
PAGE TONE TIME	This timer controls the duration of tone burst heard over the page prior to the page announcement.
PARK RECALL TIME	This timer controls the duration of time a call is parked before recalling to the call park originator.
AC-MMC LOCK OUT	This timer monitors the Web Management activity, drops the link if no action is created by Web Management and returns the system back to secure program status.
PERI-UCD REPORT	This timer is the interval that a periodic UCD report is output.
POWER DOWN TIME	This timer monitors the power to the ROM pack to begin shutdown status.
RECALL DISCONNECT	This is the time an attendant recall will ring before being disconnected.

MMC: 501

RECALL WAIT TIME	This is the time any recall (hold or transfer) to a busy station continues to wait at the station before recalling to the operator.
ROUTE OPTIMIZE	(NOT USED IN THE USA)
SMDR START/DIAL PULSE (ROTARY)	This grace period timer starts SMDR recording for rotary dialing. This timer also controls the LCD duration timer on the keysets. The duration time displayed and the SMDR time duration will be the same.
SMDR START/DTMF	This grace period timer starts SMDR recording for touchtone dialing. This timer also controls the LCD duration timer on the keysets. The duration time displayed and the SMDR time duration will be the same.
SYS HOLD RECALL	This timer determines the time calls can be left on hold before recalling back to the holding station. This is a system-wide timer. Setting timer to 000 will defeat this feature and no recalling will take place.
TRANSFER RECALL	This timer determines the time transferred calls ring before recalling. This is a system-wide timer.
TRK AUTOMOH DISC	(NOT USED IN THE USA)
TSW CONN. DELAY	This timer determines the length of time before the audio path is connected to a CO line after seizure via LCR.
UCDS AUDIO ALARM	When the Auto Attendant function is used and the digital UCD package enabled, this counter determines the maximum number of seconds a call has been waiting at the UCD group before the UCD group's SUPV key begins to flash along with an audio alarm. For more UCD alarm conditions, see MMC 500 .
UCDS VISUAL ALARM	When the Auto Attendant function is used, the digital UCD package enabled, this counter determines the maximum number of seconds a call at the UCD group before the UCD group's SUPV key begins to flash as an alarm. For more UCD alarm conditions, see MMC 500 .
VOIP RE-ROUTE TM	When the outgoing call is made via VOIP trunk and does not receive a message from the called party within this time, the call is disconnected.

MMC: 502

STATION-WIDE TIMERS

DESCRIPTION:

Allows certain station timer values to be changed on a per-station basis or for all stations.

- | | |
|----------------|--|
| 1 NO ANS FWD | This timer controls how long the station will ring before Forward on No Answer takes place. (Range: 001- 250 sec.) |
| 2 DTMF DUR. | This timer governs the duration of DTMF digits which are transmitted to an external VM system port. This can be used when a VMS system fails to recognize the default DTMF digit duration being transmitted from the DCS SLT port. (Range: 100- 9900 m sec.) |
| 3 F - DGT DELY | This timer will be valuable for the system administrator to insert a suitable delay before generating DTMF digits for In Band Integration. (Range: 00- 9900 m sec) |
| 4. OFFHK SEL | This timer controls the grace period before placing an internal/external call as programmed in MMC 306. (Range: 000- 250 sec.) |
| 5. EFWD DELAY | This timer controls how long a station will ring before the call is forwarded to an external number. (Range: 000 – 250 sec.) |
| 6. CC RNG DLY | When the station does not answer incoming call within this time, other stations with the CC key of that station will ring together. This feature only applies to the station call and station group call does not serviced (Range: 10 sec) |

MMC: 503**TRUNK-WIDE TIMER****DESCRIPTION:**

Allows certain trunk timer values to be changed on a per-trunk basis or for all trunks. It is not advisable to change these values, with the exception of trunk Flash Time, without assistance from Technical Support.

TIMER	DESCRIPTION
ANS.BAK TM	ANSwer BAcK TiMe. This timer is used for certain types of E&M signaling and does not affect normal CO lines.
CLEARING	This timer ensures that a call is fully disconnected at the CO by preventing CO access outgoing or receiving incoming ring between a disconnect and the expiration of this timer.
CO SUPV TM	CO SUPerVision TiMe this is the minimum length of loop open disconnect received from the CO that will be seen as a valid hang up on the system.
DTMF DUR.	DTMF DURation This is the length of the DTMF digits that will be sent to the CO on this line.
F-DGT DELY	First DiGiT DELaY This is the length of time the system will wait for CO line conditions to stabilize after seizure before sending DTMF digits.
FLASH TIME	This is the duration of the momentary open sent on a circuit flagged as PBX in MMC 401.
NO RING TM	This is the length of time the system will wait after detecting a ring burst on a line before deciding the call has disconnected.
PAUSE TIME	This is the length of time the system will wait before sending the next digit for a pause in a speed dial bin.
RNG DET TM	RiNG DETect TiMe This is the minimum length of ring signal the system will regard as a valid ring.
WINK TIME	This is the duration of the acknowledgment signal that the system will send on an E&M circuit (NOT USED IN THE USA).
MF/DP INT	This is the interval time between each sending digit. In the case of DTMF, if this time is set for 500 ms or more, then the time interval will be 100ms.

MMC: 503

- MFR DLY TIME** This is a delay time before a receiver will listen for DTMF for incoming call. This timer should not be changed from its default value of 0 seconds.
- DISA ANSR** This is a delay time to answer the DISA trunk call or to answer the trunk when TRK AUTO ANSWER is set to ON (MMC 400).
- CONN DELAY** This is a delay time to connect voice path when the users make outgoing call via loop trunk. This is to prevent the user from hearing noise when loop trunk is seized.

PROGRAM KEYS

- UP & DOWN** Used to scroll through options
- KEYPAD** Used to enter selections
- SOFT KEYS** Move cursor left and right
- SPEAKER** Used to store data and advance to next MMC
- ANS/RLS** Used to select ALL

ACTION

1. Press TRANSFER 503.
Display shows.
2. Dial trunk number (e.g., 704)
OR
Press UP or DOWN key to select trunk and press RIGHT soft key to move cursor
OR
Press ANS/RLS to select all trunks and press RIGHT soft key to move cursor.
3. Dial timer number from the list
OR
Press UP or DOWN key to select timer and press RIGHT soft key to move cursor.
4. Enter new timer value (must be four digits, e.g., 0700).
System returns to step 2.

Provides the ability to customize the tone cadence on a system-wide basis. There are ten tone cadences available. Please call Technical Support before changing any cadences as some systems may require default settings.

<u>TONE NAME</u>	<u>DESCRIPTION</u>
BUSY TONE	The called station is busy.
CONFM/BARGE	A feature has been successfully activated/cleared or a Barge In with Tone has been performed.
DIAL TONE	The system is ready to interpret key presses/dialed digits.
DND/NO MORE	The called station is in DND or has no free CALL buttons.
ERROR TONE	An error has been made.
HOLD/CAMPON	This is the system generated hold tone.
MSGWAT TONE	This is the dial tone heard at an SLT with a message waiting.
RGBACK TONE	The called station is ringing.
RING TONE	This is the CO ring cadence.
TRSFER TONE	This is the dial tone heard when the transfer key is pressed or an SLT hook flashes.
DID RGBACK	This is the ringback tone heard by the outside party when they dial a DID number.

MMC: 507

ASSIGN RING PLAN TIME

DESCRIPTION:

Use this MMC to program Ring Plans time settings. Ring Plans provide six separate ringing destinations based on day of the week and time of day. The start time within a plan is the time the system will switch from one ringing destination to the next. The end time is the time the system will switch from that plan to the previous plan. A RPO (Ring Plan Override) key is not needed as the system will switch automatically; however, it is helpful to have a dedicated button so the status can be manually changed if needed. If a ring plan has no time entry the ring plan defaults to ring plan 1. The ring plans correlate with all MMC's that program ring or termination destinations and station and trunk COS.

Use the following example of assigning Ring Plans:

RING PLAN	START TIME	END TIME
(MON: 1)	ST: 0000	END: 23:59
(MON: 2)	ST: 0800	END: 2200
(MON: 3)	ST: 1000	END: 2000
(MON: 4)	ST: 1200	END: 1800
(MON: 5)	ST: 1300	END: 1600
(MON: 6)	ST: 1400	END: 1500

Using a 24 hour clock in the example above notice that the END time is within the same 24 hour period. The system will stay in the last active Ring Plan from the previous day until the end time which is 23:59. Monday starts the Ring Plan 1 at 00:00. The system will stay Ring Plan 1 until 08:00 and will stay in Ring Plan 2 until Ring Plan 3 starts. As each ring Plan start it will override the previous Ring Plan. If a Ring Plan ends and there are no additional Ring Plans the system will default to the Ring Plan with time that extends past the expired ring plan time.

Note 1: Ring Plans must be programmed in sequence. IE. RP 1,2,3,4 etc.

A Ring Plan cannot be omitted. IE. RP 1,2,5 etc.

A higher numbered Ring Plan cannot have a START time before a lower numbered Ring Plan.

Note 2: Ring Plan 1 is the default Ring Plan of each day. If no Ring Plan destination is input the operator group (500/5000) is the default destination.

MMC: 511 MSG WAITING LAMP CADENCE

DESCRIPTION:

This MMC defines the cadence (flash rate) of single line telephone message waiting lamps on phones connected to a 16MWSLI. There are two main choices for the MW lamp cadence available, these being continuous and interrupted as described below. This 4SLM card supports message waiting however SLT phones connected to the 4SLM card(s) are not affected by this setting. Only 16MWSLI ports are affected on the OS 7100.

OPTION KEYS

- | | |
|---------------|---|
| 0 INTERRUPTED | The MW lamp will flash at a rate determined by the timer settings. The shortest on time is 100ms and the longest on time is 3000ms. The shortest off time is 100ms and the longest off time is 3000ms. The timer is adjusted in 100ms increments. |
| 1 CONTINUOUS | When a 16MWSLI port has a message, the lamp will be lit steady. |

PROGRAM KEYS

[MMC 602 STATION GROUP NAME](#)

MMC: 601

ASSIGN STATION GROUP

DESCRIPTION:

This MMC is used to build all station groups. There are 20 programmable groups available in a OfficeServ 7100 system.

The options for setting up these groups are as follows: A through F.

A. TYPE: This is the type of group you are creating and can be one of the following:

1. **NORMAL:** Used to assign stations in a ring group. The members can be stations, common bell contacts or Ring over Page relays.
2. **VMAA:** Used to group a number of voice mail port extensions. These must have been defined in MMC 207 as VMAA ports or they cannot be entered here. Check all programming in MMC 726 to ensure that the In band DTMF codes are properly set.
3. **UCD:** Used to build a UCD group. The OfficeServ 7100 will support two methods of UCD:

- **TYPE 1 UCD**

The group OVERFLOW/N-ANS destination (see below) is defined as an SLT port to which you must connect some type of announcement device to play to callers while they are on hold.

Please note that this type of UCD group has the following limitations.

- a) The announcement device must be able to terminate the announcement with a hook flash and a transfer back to the UCD group.
- b) Only one caller at a time can hear the announcement.
- c) Each caller connected to the announcement must hear the announcement in its entirety.
- d) It is possible that a new caller may “jump ahead” in the queue if a previous caller is currently connected to the announcement device.

MMC: 601

- **TYPE 2 UCD**

The group OVERFLOW/N-ANS destination (see below) is defined as an VMSUCD group.

The voicemail/AA will supply two recorded announcements to callers in queue. The first announcement is played only once, the second announcement will repeat for as long as the caller is in queue.

This type of UCD group has the following advantages:

- a) No external device need be installed to provide an announcement.
- b) Multiple callers can hear the announcement(s) simultaneously.
- c) Callers hearing the announcement will be transferred to a free UCD group member (agent) as soon as the agent becomes available.
- d) The callers place in queue is always maintained.

Additional programming for this type of UCD group is in MMC 607. There is a maximum of 19 UCD groups available on the system.

3. VMSUCD: This is used to group a number voicemail/AA ports to provide the UCD announcements.

4. BI-VMS: This is the voice mail group for the built in Samsung Voice Mail Card. When a Voice Mail Card is installed, group 519 must be programmed as a BI-VMS group on an OfficeServ 7100 system. Group 519 is fixed for the embedded voice mail.

5. MESSAGE: Used to group a number of extensions to serve as a message desk or message group. When one of the stations in this type of group leaves a message to another station the messaged station will return the message to the message group so any member can answer the call. If a station is a member of more than one message group, then any message indications made by that station would be for the first numerical message group they are a member of. It is not recommended to program stations in to multiple station groups.

6. SO STN GRP: This is used to group a number of S0 stations for video conference.

B. RING MODE: Each group can have one of the following ring modes. This will decide how calls are placed to the group.

- 1. SEQUENTIAL:** The stations listed as “members” (see below) will be called on a first available basis. Calls will first go to the first member, if the first member is busy, calls will go to the second member, if the second member

MMC: 601

- is busy, calls will go to the third member etc. This type of group is useful for placing the bulk of the incoming calls to a selected individual, with other members only getting the calls when the first member is busy. The number of members allowed for a sequential group is 32.
2. **DISTRIBUTED:** The first call will go to the first member, the second call will go to the second member, the third call will go to the third member. This type of group is useful for evenly distributing the call among all group members. The number of members allowed for a distributed group is 32.
 3. **UNCONDITIONAL:** Calls are placed to all group members simultaneously. This reduces the number of members of the groups to 32. If a group member is busy, they can receive off hook ring if defined in MMC 300. This ring mode option is not available for VMSUCD or VMAA groups.
- C. OVERFLOW:** This is the timer value that will cause unanswered calls to a group to begin also ringing the NEXT PORT (see below) after this timer has elapsed. If set to 000, no overflow will take place.
- D. GRP TRANSFER:** This is a timer that will determine how long C.O. calls transferred to the group will ring at the group before recalling. If set to 000, no recall will take place.
- E. NEXT PORT:** This is the station or group number that callers will also ring at if the OVERFLOW feature has been programmed. The OVERFLOW DESTINATION can be defined as:
1. **COMMON BELL** There are 2 relays available in the OfficeServ 7100 system that are defined as Common Bell.
 2. **RING OVER PAGE** This is defined by using the number of a page audio output.
 3. **STATION OR STATION GROUP.** Any station or station group can be defined as the NEXT port.
- F. MEMBER:** List all members that are to be in the group. Up to 32 members are allowed in each group, but stations can be assigned to multiple station groups.
- G. NXT HUNT:** The length of time a call will ring at a station before it hunts to the next group member.
- H. GROUP BUSY: OFF** When this option is set to ON an intercom caller will receive a busy signal when calling the group and all members of the group are busy. When this occurs then the overflow timer is bypassed as the group is not ringing.

MMC: 601

NOTES: Calls to a group do not follow the call forwarding instructions of any stations in the group.

- I. **GRP AUTOANS: OFF** When this option is set to ON, intercom calls to the group will Auto Answer/Voice Announce if the station is programmed for Auto Answer/Voice Announce in MMC 103. CO calls will follow the AUTO ANS CO setting in MMC 110 for a group member in addition to the group members setting in MMC 103.

FEATURE KEYS

0	TYPE	Group type (Normal, VM/AA, UCD, VMUCD, BI-VMS GRP, MSG GROUP, SO STN GRP, VMS UCD GRP, AA ONLY VM)
1	RING	Ring mode (Sequential, Distributed or Unconditional)
2	OVERFLOW	Overflow time (000 - 250 secs.)
3	GRP TRSF	Group transfer time (000 - 250 secs.)
4	NEXT PORT	Group or station number (e.g. group 502, station 221, 244)
5	MEMBER	Group members (e.g., station 202, 225, 231)
6	NXT HUNT	Hunt time (000 – 250 secs)

RING MODES

0	SEQUENTIAL	The first idle station listed in the group will ring. If the first is busy, the next idle station will ring.
1	DISTRIBUTED	The first call will ring the first station listed in the group. The next call will ring the next station listed in the group.
2	UNCONDITIONAL	All the stations listed in the group will ring. Busy stations will receive off-hook ring. MAXIMUM 32 STATIONS RINGING.

MMC: 602**STATION GROUP NAME****DESCRIPTION:**

Allows the system administrator or technician to enter an 11-character name to identify an individual station group.

Names are written using the keypad. Each press of a key selects a character. Pressing the next key moves the cursor to the next position. For example, if the directory name is SAMSUNG, press the number 7 three times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key changes the letter from upper case to lower case.

NOTE: When the character that you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move cursor left. A space can be entered by using these keys.

- **iDCS, DS and ITP KEYSETS**

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	space	?	,	!	1

ASSIGN TRUNK GROUP

DESCRIPTION:

Allows the assignment of trunks to a specific trunk group or to several trunk groups. This is very useful in the programming of LCR when more than one trunk is to be in several dialing plans. There are two different modes of operation: (1) sequential and (2) distribute. There are 11 programmable trunk groups in a system with up to 60 members per group.

WARNING: One trunk can appear in more than one trunk group. If necessary, delete the trunk member from other groups to prevent accidental access.

MMC: 606

ASSIGN SPEED BLOCK

DESCRIPTION:

Provides a means of adding or deleting speed dial blocks to the system or an individual keyset. With the ability to delete a block or blocks or speed dial, it will not be necessary to waste these on such items as voice mail, DPIMs or stations that do not require the ability to use speed dial. The Free List will show how many bins are left to be assigned. All entries refer to blocks of 10 numbers or bins.

A library of up to 2000 speed dial numbers may be allocated as needed on a OfficeServ 7100 system. These total library of numbers is split between the System Speed Dial list with the balance being shared between stations. The system list can be set for either 500 or 950 numbers using MMC 861. Each station can have up to 50 numbers. Speed dial numbers are assigned in blocks of ten. Each speed number may contain up to 24 digits.

PROGRAM KEYS

MMC: 607

UCD OPTIONS

DESCRIPTION:

Sets up UCD options in the Samsung Embedded Voicemail. MMC 601 must have already been used to define a UCD group with an overflow destination of VMSUCD port or group. (A group is preferred over a port because a group allows multiple paths into the voicemail and therefore has greater traffic handling capabilities.) When a group overflow timer in MMC 601 expires, the caller will be routed to the voicemail. It is here that the caller is played the UCD “FIRST MESSAGE” and “SECOND MESSAGE” while in queue. This will continue until an agent becomes free or the caller is transferred to a final destination.

This MMC includes options to select messages to play to a caller. These messages can be as follows:

MESSAGES 1000–9999

These messages can be recorded on the embedded voicemail. These are the default pre-programmed messages:

- 5061: “I’m sorry, all stations are presently busy”
- 5062: “I’m sorry, all stations are still busy”

The following program options apply:

FIRST MESSAGE

After the caller has overflowed from the UCD group, the first message will immediately play. For instructions on how to make these recordings. The default message is #5061 “I’m sorry, all stations are presently busy.”

This message will only be played once for the caller.

SECOND MESSAGE

If no agent has become free after the UCD recall time (see UCD Recall), the caller will be played the second message. For instructions on how to make these recordings. The default message is #5062 “I’m sorry, all stations are still busy.”

This message will be repeated for as long as the caller is in queue, at an interval specified in the UCD Recall Timer below.

MMC: 607

EXIT CODE

While the caller is hearing a message (but not during MOH), the caller may dial the DTMF digit specified here and be transferred immediately to the final destination ([see Final Destination](#)). The exit code is optional and does not need to be used. If used, the first and second messages may be modified to provide instructions on its use.

RETRY COUNT

The UCD program is designed to route a caller to a "final destination" after a programmable number of "loops" through the UCD message. The range of this counter is 0 to 99. 00 means that there is no retry counter and the caller will remain in the UCD queue until answered. Any non zero value will route a caller through the UCD loop that many times before going to the final destination. The UCD will route calls to the final destination immediately if all members of the group are either out of group or in DND.

Example: If this counter is set to 02, callers reaching a busy group will hear the first UCD message, be placed on hold, hear the second UCD message, be placed on hold, and finally hear the second message again before being transferred to the final destination. The default is 99.

FINAL DESTINATION

This is the final destination for the caller if not answered by a UCD agent. This destination is only reached if (a) the caller dials an exit digit during a message or (b) the retry count has expired. The final destination can be any station number (in a network), any group number (within a network) or a disconnect. A disconnect is entered as a destination of NONE (HOLD key).

1. If the final destination is a voice mail port, the port will receive a FWD from UCD group integration message.
2. The final destination will forward or overflow, if the forward to destination is a voice mail port the port will receive FWD from UCD group integration message.
3. If the final destination is not forwarded, the call will ring or camp on to the final destination indefinitely.
4. The default final destination is 500.

To ensure that you do not get a situation where all the call buttons are busy on the final destination it is advisable to make the final destination a group (even if the group has only one station in it.)

MMC: 607

RING NEXT

This timer must be shorter than the overflow timer in MMC 601. If a higher value is entered, the display will show invalid entry. In the case where a UCD group has the ring next timer set at 000, an unanswered call will rotate evenly among all agents until it is answered. The UCD greetings will be heard during this routing process, but can be removed by defining the UCD messages in MMC 607 as unrecorded message numbers. This will simulate a circular hunt group. The default is 010.

UCD RECALL

After a caller has heard a UCD announcement, he/she will be placed on hold until an agent becomes available or the UCD recall timer expires. When the UCD recall timer expires, the caller will again hear the UCD announcement. The range is 000–250. The default is 010.

MUSIC ON HOLD SOURCE

This option determines what Music on Hold source the callers will be connected to between messages. The choice is either an external source, tone, none or a message site in SVM.

WRAP UP

This option will make a UCD agent unavailable to receive additional UCD calls after hanging up from the last one. This is to allow agents to complete work associated with the previous call before the next call begins ringing. The range is 000-250. The default is 010.

AUTO LOG OUT

This ON/OFF option determines if a station will automatically log out of the UCD group when the RING NEXT timer expires. This setting will be ignored if the RING NEXT timer is set to 000. This option is set to ON by default.

ALLOUT→FINAL

This ON/OFF option determines if calls forward to the UCD final destination when all stations are logged out of the UCD group. If no UCD final destination is assigned then the call will disconnect. This option is set to ON by default.

AGENT PIN NO

If an agent wants to enter a UCD group, specifies whether an agent code for UCD will be pressed.

MMC: 607

GBUSY NEXT

This ON/OFF option specifies if all agents are busy, specifies whether the next port is called immediately during overflow time.

ACTION

1. Press TRANSFER 607.
Display shows.
2. Press UP or DOWN to select UCD group or dial group number
OR
Press LEFT soft key to position cursor under message number and enter new message
OR
Press RIGHT soft key and advance to next option using the UP and DOWN keys to select an option.
3. Press RIGHT soft key and advance to next option Use the UP and DOWN keys to make a selection or make a selection using the dial pad.

MMC: 614 SET A STATION/C.O. LINE CALL GROUP

DESCRIPTION:

This program is used to define on build "USE" groups to restrict calling. You can assign stations to a specific STATION USE GROUP and trunks to a specific TRUNK USE GROUP.

Definable USE GROUPS:

STATION USE GROUPS = 001 to 100
TRUNK USE GROUPS = 101 to 200

Example of how to use: Initially all stations can call all other stations because they are all in Station Use Group 001. Put stations 225 to 250 in Station Use Group 002 then go to MMC 314 and restrict 001 from using or calling 002.

Now put trunks 711 to 720 in Trunk Use Group 302 then go to MMC 304 and set ANS:NO and DIAL:NO for Station Use Group 001.

You have now restricted station 201-224 (001) from using trunks 711-720 (301). Stations 201-224 (001) can not call station 225-250 (002).

Note: Station Use Groups and Trunk Use Groups must be in the same Tenant Group, either 1 or 2.

PROGRAM KEYS

MGI GROUP

DESCRIPTION:

This optional program sets designated MGI channels for specific services. This allows “grading” of MGI card(s) for traffic conditions. The MGI channels can be segregated into groups. Keep in mind that any entries made here can be ineffective, if conflicting entries exist in MMC616.

- **LOCAL ITP:** This determines what MGI channels can be used with ITP keyphones across a private IP network
- **PUB IP ITP:** This determines what MGI channels can be used with ITP keyphones on a public IP network.
- **VOIP NTWK:** This determines what MGI channels can be used for enhanced proprietary Samsung VoIP networking (SPNet) between OfficeServ 7400, OfficeServ 7100, OfficeServ 7200, OfficeServ 500 and the OfficeServ 100 systems across a private IP network.
- **PUB IP NTWK:** This determines what MGI channels can be used for enhanced proprietary Samsung VoIP networking (SPNet) between OfficeServ 7400, OfficeServ 7100, OfficeServ 7200, OfficeServ 500 and OfficeServ 100 systems on a public IP network
- **VOIP TRUNK:** This determines what MGI channels can be used as industry-standard H.323 or SIP VoIP trunks for communications across a private network
- **PUB IP TRK:** This determines what MGI channels can be used as industry-standard H.323 or SIP VoIP trunks for communications on a public network
- **ITP PAGED:** This determines which MGI channels can be used for ITP internal station page.

The MGI channels can be regarded as trunks and allow two selection modes: Sequential or Distributed.

The members of each selection are the actual channels on the MGI card(s)

MMC: 616

MGI USER

DESCRIPTION:

This optional program selects which specific MGI channels will be dedicated on a per-port basis for IP station/trunk devices. If this MMC is not utilized, allocation of MGI channels will be controlled by MMC 615. By defining dedicated MGI port usage, the IP station/trunk selected will always use the port programmed. MGI channels can be assigned private and public ITP stations (32XX), VoIP Networking trunks (83XX), H.323 trunks (84XX) and SIP trunks (85XX). Only one assignment per MGI port is permitted. Any entries made here will override entries made in MMC 615.

MMC: 702

TOLL DENY TABLE

DESCRIPTION:

Provides a way to make toll restriction (call barring) very easy and flexible. There are 500 entries in the deny table and each entry index can be assigned to a class of service. Each index can have up to 12 digits. With the use of wild cards (MMC 704 Assign Wild Character), more flexibility can be built into toll restriction. Wild cards can be used repeatedly in the dial string, limited only to what is allowed or denied in MMC 704. There are six toll levels, B to G, that are programmable. Toll level A is set as unrestricted by default and toll level H is set as in-house only by default.

MMC: 705 ASSIGN SYSTEM SPEED DIAL

DESCRIPTION:

Enables the assignment of system speed dialing numbers. There are up to 200 entries available for programming ([see MMC 606](#)) if SYSTEM SPEED DIAL MAX = 500 in MMC 861 or 950 available if SYSTEM SPEED DIAL MAX = 950 in MMC 861. Each speed dial number consists of a trunk or trunk group access code followed by a separator and up to 24 digits to be dialled. These dialed digits may consist of 0-9, * and #. If the system recognises a valid trunk or trunk group access number, it will automatically insert the separator.

MMC: 706 SYSTEM SPEED DIAL BY NAME

DESCRIPTION:

Allows an 11-character name to be entered for each system speed dial location. This name enables the speed dial number to be located when using the directory dial feature. The directory dial feature allows the display keyset user to select a speed dial location by scanning its name.

Names are written using the keypad. Each press of a key selects a character. Pressing a different key moves the cursor to the next position. For example, if the directory name is SAM SMITH, press the number 7 three times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing the A key changes the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

• iDCS, DS and ITP KEYSETS

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2

MMC: 709 TOLL PASS CODE / SPECIAL CODE TABLE

DESCRIPTION:

This MMC provides a means to program three trunk code tables as described below.

PBX ACCESS CODE: This table contains up to five entries and is used to identify the trunk access codes needed for toll restriction to be properly applied when the system is used either behind a PBX or with CENTREX-supplied dial tone. Toll restriction will only be applied on trunks flagged as PBX in MMC 401 if a trunk access code entered in this table is dialed. Toll restriction will be applied to the digits following the trunk access code.

SPECIAL CODE: This table identifies to the system dialling rules the special feature codes used to activate central office custom calling features such as CID Block and call waiting disable. The special feature codes can be used on a per call basis without affecting LCR or toll restriction programming. There is a maximum of ten (10) entries available each of which may be up to four digits long. The four dialing rules that apply to the Special Code Table are as follows:

- Rule 1. Toll restriction is only applied to digits following the entries in the Special Code Table. This eliminates toll restriction bypass with second dial tone central office features such as CID block (*67).
- Rule 2. LCR will only route calls based on the digits following the entries in the Special Code Table. This rule allows end user per call special code activation.
- Rule 3. LCR modify digits tables will only delete digits following the Special Code Table entries. This allows central office features such as CID block to be used when LCR deletes digits. Can be used in Foreign Exchange (FX) routing by removing the 1+ area code..
- Rule 4. LCR modify digits tables will only insert digits after the Special Code Table entries (MMC 718). This allows for central office features such as call waiting block to be activated but route the call with a specific PIC code such as 10288 (AT&T).

Example of Rule 4: User dials *67 1 305 529 2900, the system will seize a C.O. line and dial *67 10288 1 305 529 2900.

MMC: 709

TOLL OVERRIDE: This table of eight entries is used to identify to the system numbers that will bypass all dialing restrictions. This bypass includes Toll restriction, Trunk access and forced authorization or account codes. Each entry in the table can be up to 14 digits long.

OVRD USE TRK GRP: This entry designates the trunk group that override calls will access.

LCR DIGIT TABLE

DESCRIPTION:

The LCR DIGIT TABLE contains all numerical digits for the completion of outgoing call placement. This table works in conjunction with LCR ROUTE TABLE, LCR TIME TABLE and LCR MODIFY DIGITS TABLE. There is a maximum of 2000 entries for a system with a digit string length of 10 numerical digits. This system automatically maintains entered digit strings in numerical order. The characters * and # are also accepted for use with feature codes.

LCR TIME TABLE

DESCRIPTION:

This table gives the flexibility to the system, through the LCR ROUTES, to allow calls placed at any given time of day to use the least cost trunk route that is available. When LCR ROUTE ADVANCE is allowed, it is possible for calls to be placed on more expensive trunks on any given time of day. There are four possible time entries per day; the start time of the next time period is the end time of the previous time period.

LCR ROUTE TABLE

DESCRIPTION:

The LCR ROUTE TABLE is responsible for selecting a specific trunk group in the completion of an outward bound call. This table works in conjunction with LCR DIGIT TABLE, LCR TIME TABLE, LCR COS TABLE and LCR MODIFIED DIGITS TABLE. After the user dials a valid digit string, the system uses the LCR ROUTE TABLE to select a specific predetermined trunk group. There is a maximum number of 99 routes available. If more than one trunk group is available for call completion, the system uses the first designated trunk group and then starts to utilise succeeding trunk groups. If all trunk groups are busy in a selected route, call queue becomes active and allocates trunks as they become available.

LCR MODIFY DIGIT TABLE

DESCRIPTION:

This program entry is also referred to as Outdial Rules. This will give the system the ability to add or delete a digit string or singular digit if needed to complete a call. A perfect example is the adding of a digit "1." An advantage is to insert a common carrier network access code of 1010288 (ATT®). With these digits inserted, a long distance call will be placed over a local line utilizing the common carrier network. The characters * and # can also be entered. There are 200 modify digit entries available.

RELATED ITEMS: [MMC 710 LCR DIGIT TABLE](#)

MMC: 714 DID NUMBER AND NAME TRANSLATION

DESCRIPTION:

Assigns an incoming DID call to a specific ring plan destination. It also provides a call waiting option, if needed, so that a second incoming DID call can be received. The table is also used to define which MOH source a caller to that DID number will hear when placed on hold. An 11 character name can be added to the number. There are a maximum of 999 entries. If there is no matching number on DID service the call is routed to the operator group for that ring plan.

Definitions of option are as follows:

1. **DGT:** Digits to be received from CO. Up to 16 digits may be entered.
2. **MOH SOURCE:** Allows the technician to select what the calling party will hear in regards to that DID/DNIS number if the call is placed on hold. There are a total of 6 possible music selections (see below).

With the embedded voicemail, you may also select a voicemail recording as a music source. The recording must already been defined in MMC 748 and will show up here as the SVM port associated with the recording.

OPTIONS

- 2.1 **NONE:** No Music on Hold. Follows the setting in MMC 408 for the trunk the call comes in on.
- 2.2 **tone:** A repeated tone is played to the outside party.
- 2.3 **INTERNAL CHIME:** This is entered as the directory number of the music source on the MCP (3761).
- 2.4 **EXTERNAL DEVICE:** Music Source or Digital announcer. This is entered as the directory number of an external music source.
- 2.5 **VOICE MAIL SOUND FILE:** If the OfficeServ 7100 system has an embedded voicemail, up to 100 custom recorded sound files from the embedded voicemail can be used for MOH sources. Select the voicemail port assigned in MMC 748. If you select this option be advised that each VM MOH source requires a dedicated voicemail port/channel.

MMC: 714

3. PRI = DID priority option. There are 9 priority levels: priority 1 is the highest and priority 9 is the lowest.

When calls arrives into a station group and group members are all busy the call is queued. The system will assign a priority to the DID number so that calls from a high priority DID number will be placed at the front of the group queue.

4. 1: XXX, 2: XXX, 3: XXX, 4: XXX, 5: XXX, 6:XXX = ring plan and destination during each ring plan. The destination can be a station, station group, trunk or trunk group. If trunk or trunk group is selected the trunks must be programmed as E&M trunks to allow the received digits to be re-sent on the facility(s). This is referred to as DID Repeat digits over tie line.

NOTE: An entry of the character "B" means to repeat the received digits.

5. CW: Call waiting Yes/No . Allow a second DID call to be received
6. MC: This is the maximum number of simultaneous calls to this DID the system will allow. If more call attempts are made the system will return a busy signal to the caller.
7. DC: The number of digits to delete. This is useful with Tandem switching, mixed numbering plans and DID Repeat digits over tie line. Maximum number of digits that can be deleted is 16.
8. NAME: Input up to 11 characters to identify call.

Names are written using the keypad. Each press of a key selects a character. Pressing the dial pad key moves the cursor to the next position. For example, if the directory name is "SAM SMITH," press "7" three times to get the letter "S." Press "2" once to get "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key changes the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

9. TONE: Ring tone options for a specific DID number (No. 1~8).
10. CAD: Ring cadence options for a specific DID number at SLT's (No. 1~5).

IDLE DISPLAY

DESCRIPTION:

This program allows the technician or system administrator to create 10 sixteen character messages (pieces of information) that can be viewed by users with an ITP-5012L model IP keyset. All 10 messages can be displayed simultaneously. The individual user must use MMC 120 to select idle display option as "INFORMATION". The default setting is 'CALENDAR'.

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

MMC: 721 SAVE STATION KEY PROGRAMMING

DESCRIPTION:

Provides a service tool which will minimize the accidental loss of programmable keys on the OfficeServ 7100 electronic keysets. The method of operation is simple, first the data is saved and then the station can be replaced with another station type or the keys can be reprogrammed to other features. Once testing or replacement is completed, the data can be restored to the individual station, providing the same type is in place.

NOTE: This program is not to be confused with AUTO SET RELOCATE (MMC 315). This program is for saving and restoring the same electronic device type at that port.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC

MMC: 722 STATION KEY PROGRAMMING

DESCRIPTION:

Allows the customizing of programmable keys on specific electronic keysets, or 64 button module on the OfficeServ 7100 system. For AOM's and 64 button DSS box's all buttons are set as DS keys by default. Features are entered via dial pad keys by pressing the dial pad number the required number of steps to select the feature. For example, for OHVA, the number 6 is pressed three times. If the BOSS key is required, press 2 for the first letter B and then use the UP or DOWN key to change the selection from BARGE to BOSS.

DIAL KEYPAD

COUNT	1	2	3
DIAL 2	ABAND	BARGE	CAD

MMC: 723 SYSTEM KEY PROGRAMMING

DESCRIPTION:

This MMC is much like MMC 722, Station Key Programming. The main difference is that this MMC is system-wide rather than on a per-station basis. Features are entered via the dial keypad by pressing numbers as shown in the table. For example, for OHVA the number 6 is pressed three times. If the BOSS key is required, press 2 for the first letter B, and then use the UP or DOWN key to change selection from BARGE to BOSS.

MMC: 724**DIAL NUMBERING PLAN****DESCRIPTION:**

This MMC allows the technician to change directory numbers for stations, trunks, station groups, trunk groups and feature access codes. The system can be preprogrammed with a default three or four digit numbering for station, station groups and trunk numbers depending on the position of the DIP switches on the MCP card. Default numbering plan is only assigned once the system is powered up for the first time OR once the system memory has been manually cleared. There is an error message provided to prevent the accidental duplication of a directory number or feature access code.

DIAL	OPTION	DESCRIPTION
00	STN NUM PLAN	This is where station directory numbers are changed or assigned
01	TRK NUM PLAN	This is where trunk directory numbers are changed or assigned
03	MISC NUM PLAN	This is where directory numbers for relays, MOH ports, and the Internal Modem are changed or assigned
04	STNG NUMBER PLAN	This is where station group numbers are changed or assigned
05	TRKG NUMBER PLAN	This is where trunk group numbers are changed or assigned
06	FEAT NUMBER PLAN	This is where feature access codes are changed or assigned. Dialing codes are entered via the dial pad key by pressing the dial pad number, the required steps to select this feature. For example, for OHVA, the number 6 would be pressed three times. NOTE: Please remember that this program is system-wide.
07	SO-STN NUM PLAN	NOT USED IN USA.
09	NTWK LCR NUMPLAN	This is where additional LCR access codes are entered in the case where two or more systems are networked together.
10	VIRT EXT NUMPLAN*	This is where virtual station directory numbers are changed or assigned.

MMC: 724

11	MGI NUM PLAN	This is where the MGI port directory numbers are changed or assigned.
12	ITP NUM PLAN*	This is where IP-based station directory numbers are changed or assigned
13	WLAN NUM PLAN	This is where wireless handsets directory numbers are assigned or changed.
14	SPNET NUM PLAN*	This is where Samsung proprietary switch-to-switch enhanced IP networking port directory numbers are changed or assigned
15	H323T NUMPLAN*	This is where VOIP H.323 trunk port directory numbers are changed or assigned
17	SIP-T NUM PLAN*	This is where VOIP SIP trunk port directory numbers are changed or assigned
18	IP-UMS NUM PLAN	This is where IP UMS directory numbers are changed or assigned (FOR FUTURE USE)
19	SIP-S NUM PLAN	This is where SIP-based station directory numbers are changed or assigned (FOR FUTURE USE)

IMPORTANT:

***The num plans that are marked with "*" are affected by the virtual cabinet configurations in MMX 857. See MMC 857 for details.**

SMDR OPTIONS

DESCRIPTION:

Allows the system administrator to select the information printed on the SMDR report. The following options may be selected to print on SMDR:

- | | |
|---------------------|--|
| 00. PAGE HEADER | This option determines whether a page header will print at the top of each page. This would normally be turned off if SMDR is being sent to a Call Accounting machine. |
| 01. LINE PER PAGE | This option selects the length of each page to determine when to print the SMDR header. The number of lines may be in the range 01–99. |
| 02. INCOMING CALL | This option determines whether incoming calls will print on SMDR. |
| 03. OUTGOING CALL | This option determines whether outgoing calls will print on SMDR. |
| 04. AUTHORIZE CODE | This option determines whether authorization codes will print on SMDR. |
| 05. SMDR START TIME | This option determines whether valid calls will include the minimum call time in total call duration. |
| 06. IN/OUT GROUP | This option allows a message, IN GROUP or OUT GROUP, to be printed in the digits dialed column each time a station enters or leaves a group. |
| 07. DND CALL | This option allows a message, IN DND or OUT DND, to be printed in the digits dialed column each time a station enters or leaves DND. |
| 08. WAKE-UP CALL | This option determines whether stations receiving an alarm reminder call will print on SMDR. |
| 09. DIRECTORY NAME | This option allows the system administrator to enter a 16 character name which will appear on the SMDR header. |

MMC: 725

10. CALLER ID† DATA This option can be selected to print Caller ID data received from the Central Office on incoming calls. This option requires the use of a 132 column (wide carriage) printer or an 80 column printer set for condensed print.
11. ABANDON CALL† If this option is set to YES, unanswered calls for which CID information was received will print on SMDR.
12. NO. OF DIAL MASK If this option is set to a numeric value, the selected last digits of the number dialed field will be masked as asterisks (*) on the SMDR print out. Maximum masked digits is 18.
13. INCOMING ANSWER If this option is set to YES, the duration of calls ringing before answered will print on SMDR.
14. INTERCOM CALL If set to YES intercom calls will print on SMDR.
15. KEY MMC IN/OUT If set to YES then the SMDR record will show programming being opened and closed in MMC 200 and MMC 800.
16. HOTEL CALL COST This option determines if the cost of the Hotel Room will be presented on the SMDR printout (NOT USED IN USA).
17. HOTEL PAGE FEED This option determines at which point, the printer will perform the page feed function (NOT USED IN USA).
18. HOTEL START LINE This option determines the point at which the system will begin counting, to determine which line to begin printing reports (NOT USED IN USA).
19. ITP REGISTRATION: When set to YES, whenever an ITP set registers with the system the SMDR record will show the station number in the EXT field and the IP address and signalling port in the ACCOUNT field.
19. SET RELOCATION: When set to YES the SMDR record will print set relocation activity. One station number will print in the EXT field and the other station number will print in the ACCOUNT field.

MMC: 725

The DIRECTORY NAME that appears on the SMDR header is programmed as follows:

Names are written using the keypad. Each press of a key selects a character. Pressing the next key moves the cursor to the next position. For example, if the directory name is SAM SMITH, press the number 7 three times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key changes the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the right soft key to move the cursor to the right.

- **iDCS, DS and ITP KEYSETS**

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3

MMC: 726

VM/AA OPTIONS

DESCRIPTION:

(NOT USED IN USA)

This MMC is used to define all the in band DTMF codes sent to SLT voice mail ports for an external VM system. These in band codes can be 0-9, A, B or C, and performed two functions. Note that this MMC is not used for Samsung in-skin VM systems.

1. CALL AND TYPE INFORMATION

This is a DTMF signaling string sent to a voice mail port when the voice mail port answers a call. This DTMF information tells the voice mail port what type of call it is receiving and where the call is coming from. e.g. call has forwarded from extension 225

2. CALL PROGRESS TONES

These are sent to the voice mail system to provide information about the progress of the call. e.g. ringback, busy or disconnect.

Most Voice Mail systems can utilize DTMF in band signaling for more efficient call processing. This MMC has many parameters that can be programmed according to the type of automated attendant and/or voice mail system connected.

CALL and TYPE INFORMATION

The format of the DTMF data sent to a VM/AA port is as follows:

[CALL TYPE] + [DN1] + [SEPARATOR] + [DN2]

an example of this would be

[FORWARD ALL] from [225] on trunk [703]

Each field can be programmed individually as follows:

EXTENSION FOR DN1: If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 7100 will send data in the DN1 field indicating that a station is ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the OfficeServ 7100 system will not send station data in the DN1 field.

MMC: 726

TRUNK FOR DN1: If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 7100 system will send data in the DN1 field indicating that a trunk is ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the OfficeServ 7100 system will not send trunk data in the DN1 field.

EXTENSION FOR DN2: If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 7100 system will send data in the DN2 field indicating the originating station of the call ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the OfficeServ 7100 system will not send station data in the DN2 field.

TRUNK FOR DN2: If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 7100 system will send data in the DN2 field indicating the originating trunk of the call ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the OfficeServ 7100 system will not send trunk data in the DN2 field.

SEPARATOR: When both DN1 and DN2 are used, a digit defined here is sent between DN1 and DN2 so the VMAA system can determine where DN 1 stops and where DN 2 starts. The separator can be DTMF 0 through 9, A, B or C

DISCONNECT: This is the call progress digit sent to the VMAA port in place of a disconnect open. The digit defined here is sent three times.

CALLER ID NUMBER: If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 7100 will send Caller ID data as DTMF tones to the VMAA port.

CALL TYPE ID: This is the DTMF digit that is sent first in the in band digit string and can identify any of the following call types:

- | | |
|-----------------|--|
| 0. DIRECT CALL | A call originating directly from another station in the system. |
| 1. ALL FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD ALL set. |

MMC: 726

- | | |
|-----------------|--|
| 2. BSY FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD BUSY set. |
| 3. NOA FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD NO ANSWER set. |
| 4. RECALL | A call is recalling the VM/AA port after being transferred and not answered. |
| 5. DIR TRK CALL | A C.O. call has gone directly to VM/AA (e.g., trunk 717 DIL to VM/AA). |
| 6. OVERFLOW | A call has OVERFLOWED to the VM/AA port from a station group. |
| 7. DID CALL | A DID call has called the VM/AA port. |
| 8. MESSAGE CALL | A message button or message reply feature code has been used to call the VM/AA port. |

PROGRESS TONES

These are the DTMF codes that is sent to the VMAA port in place of regular progress tones. For example, when a VMAA port goes off hook to originate or transfer a call, instead of hearing normal dial tone, it will hear DTMF “ BA “ . Progress tones can greatly increase the efficiency of a VMAA system because it is easier and quicker to detect DTMF than a busy, ringback or DND tone.

Progress tones can identify any of the following.

<u>TONES</u>	<u>VALUE</u>
0. DIAL TONE	BA
1. BUSY TONE	4
2. RINGBACK TONE	5
3. DND NO MORE	6
4. HDSET ANSWER	3
5. SPKER ANSWER	2

MMC: 726

GENERAL RULES

1. 201 is talking to a trunk and presses TRANSFER plus the station number, but the station is forwarded to VM/AA and VM/AA answers. When this happens, if 201 presses TRANSFER again to return to the trunk, the VM/AA port is not on hold. It is disconnected.
2. A VM/AA port leaves a message indication for a station. When the station returns the message, any available port in the VM/AA group should ring, not only the one that left the message.
3. A VM/AA port leaves a message for a station. When the station returns the message, the MESSAGE LED is not automatically turned off. If a VM/AA system turns on the MESSAGE LED, the VM/AA system must turn it off.
4. If DTMF call progress tones are not enabled, the system sends regular call progress tones (see Item # 3).
5. When a VM/AA port calls a station that is in the AUTO ANSWER or VOICE ANNOUNCE mode, the keyset will be forced to ring.
6. All calls to a VM/AA port or group ring with C.O. line ringing cadence, not intercom ring cadence.

EXAMPLES OF VM/AA OPERATION (IN BAND DTMF DIGIT STRING)

In the following example, all call and type data is turned on unless otherwise stated. x is the separator digit, all-default values are used in these examples and [] is not used.

A DIL 701 calls a VM/AA port or group:

[*]+[701]+[]+[]

In the above example, if C.O. information is not used:

[]+[]+[]+[] (Nothing is used)

DIL 701 calls a call-forwarded station (205):

[#]+[205]+[X]+[701]

In the above example, if forward information is not used:

[]+[205] +[X]+[701]

In the above example, if forward and DN2/C.O. information is not used:

MMC: 726

[]+[205]+[]+[]

DIL 701 calls group 501 that overflows to VM/AA:

[#]+[501]+[x]+[701]

In the above example, if overflow information is turned off:

[]+[]+[]+[] (Nothing is sent)

A DID call rings the VM/AA directly:

[B]+[9999]+[]+[]

9999 are the DID digits from C.O.

In the above example, if did information is turned off:

[]+[9999]+[]+[]

A station transfers (blind or screened) a call (C.O., DID or intercom) to VM/AA group or port. When the transferring station hangs up (blind transfer):

[]+[]+[]+[] (Nothing is sent)

A station (202) transfers a C.O. call (702) to a station (225) that is Call Forward All to a VM/AA group or port. When the transferring station hangs up (blind transfer) and the VM/AA group or port answers:

[#]+[225]+[x]+[702]

A station (202) transfers a C.O. call (702) to a group (501) that overflows to a VM/AA group or port:

[#]+[501]+[X]+[702]

In the above example, if overflow information is turned off:

[]+[]+[]+[] (Nothing is sent)

A station (205) calls a VM/AA port or group :

[*]+[205]+[]+[]

In the above example, if direct information is turned off:

[]+[]+[]+[] (Nothing is sent)

A station (205) calls using MESSAGE key:

[*]+[205]+[]+[]

In the above example, if message information is turned off:

[]+[]+[]+[] (Nothing is sent)

A call (702) recalls back from station 225 to the VM/AA group:

MMC: 726

[#]+[225]+[x]+[702]

In the above example, if recall and DN2/CO information are turned off:

[]+[]+[]+[] (Nothing is sent)

MMC: 728 CID / ANI TRANSLATION TABLE

DESCRIPTION:

Allows the system administrator or technician to associate a CID or ANI number received from the central office with a name programmed in this translation table. If there is no match between a received number and a name in this table, "no CID name" will be displayed.

The translation table consists of 1000 entries for a OfficeServ 7100 system. Each entry is comprised of a ten-digit (14 digits allowed) telephone number and a 16-digit name.

Names are written using the keypad. Each press of a key will select a character. Pressing the next key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the VOL UP key to move the cursor to the right.

- **iDCS, DS and ITP KEYSETS**

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3

MMC: 729 RATE CALCULATION TABLE

DESCRIPTION:

The RATE CALCULATION TABLE is used to define the billing charges for each COST RATE. These rate tables correlate with the Trunk Cost Rate and the Costing Dial Plan. There are eight call costing rates. Each rate has the following data fields.

FIRST INTERVAL DURATION: This is the amount of time at the beginning of each call to which a fixed cost is applied. The range is from 0 to 999 seconds, for example, 180 seconds (three minutes).

FIRST INTERVAL COST: This is the dollar cost for the first interval duration. The range is from 0 to 999, for example, 345 (\$3.45).

SECOND INTERVAL DURATION: This is the amount of time for the duration of each billing increment after the first interval has expired. The range is from 0 to 999 seconds, for example, 006 seconds (six seconds).

SECOND INTERVAL COST: This is the dollar cost for each billing increment. The range is from 0 to 999, for example 100 (\$1.00).

SURCHARGE: This is a one-time charge that is applied to the call over and above the time charges. The range is from 0 to 999, for example 150 (\$1.50).

MMC: 730

COSTING DIAL PLAN

DESCRIPTION:

The COSTING DIAL PLAN is used to analyze the leading dialed digits of a dialed number and determine what DIAL PLAN it is to follow. Data entry for this program is in three fields: ENTRY, DIGITS and COST RATE table reference.

DIGITS: Up to 500 entries may be made. Each entry can be up to ten digits. These are the entries that will be searched to find a match with the digits dialed by the station making the call. This is a leading digits table and the system will look for the exact leading digits in the table that match the number dialed. For example, if a user dials 1305 and the COSTING DIAL PLAN contains 1, 1308 and 1312, the dialed digits will be matched to 1 because 1308 and 1312 do not form a complete match. When this table is created by the technician or when any new entries are added, the system automatically places all entries in numerical order.

Wild cards (*) can be used to represent any digit. The Toll Restriction Wild Character assignment (MMC 704) is common with Call Costing and Toll Restriction. When all entries are used, [LAST ENTRY] is displayed.

DIAL PLAN

This shows in the programming display as DP and represents a pattern (1–7, 8). This pattern is used by MMC 422 TRUNK COST RATE, to determine the correct billing according to MMC 729 RATE CALCULATION TABLE

When the system finds a DIAL PLAN match for the digits dialed, the system checks MMC 729 to see what RATE CALCULATION to use for costing the call.

EXAMPLES

When a station user dials a number, the system will search the COSTING DIAL PLAN to find a match. If 13056 is dialed and this MMC contains entries 1, 13, 1305 and 1401, 1305 is the closest match and this entry will be selected. If 1305 is dialed and this MMC contains entries 1, 13, 13056 and 1401, no action will be taken until the station user dials another digit. If the next digit is 6, the 13056 entry is the closest match and this entry will be selected, but if the next digit is anything other than 6, the 13 entry is the closest match.

Whenever a new entry is added, the system will sort all entries in numerical order because this is the logical order in which the system analyzes digits. Wild cards are

MMC: 730

checked after exact digits. If 1813 and 18** are entered, the system will check 1813 first. If no match is found, it will check 18**.

VM CARD RESTART

DESCRIPTION:

This MMC is only used for the Samsung embedded Voice Mail.

There are two options available in this MMC:

DOWNLOAD

When the system starts, part of the power up procedure will download data from the system to determine time, date, what mailboxes to create, and system numbering plan. This must be done at least once, but once done this download feature can be turned OFF to save boot up time.

CARD RESTART

If this option is set to YES the voicemail application will immediately restart according to the download OPTION specified above.

VIRTUAL NUM DOWN

When the voicemail application restarts, if this option is set to YES for any of the categories under this heading, it will create the additional mailboxes. This must be done at least once, but once done this download feature can be turned OFF to save boot up time. The categories are:

TYPE	DESCRIPTION
VIRTUAL EXT	Virtual extension numbers.
DESKTOP ITP	DESKTOP IP-based phone number
MOBILE ITP	Wireless IP-based mobile phone number
BRI STATION	ISDN terminal numbers-NOT USED IN THE USA
VoIP NET TRK	VoIP networking trunk numbers
VoIP 323 TRK	VoIP H.323 trunk numbers
VoIP SIP TRK	VoIP SIP trunk numbers
REMOTE STN	Stations in remote nodes when networking. (Used for Centralized Voice Mail Applications)
SIP STN	SIP-based phone number

MMC: 741

USER MAILBOX

DESCRIPTION:

This MMC is only used for the Samsung embedded Voice Mail. It assigns each station or group as having a mailbox (yes or no). When stations or groups are flagged as YES, during Voice Mail card power up mailboxes will be created for each directory number with a "YES" entry.

Once the Voice Mail database has been created new boxes can be added.

- a) Through Voice Mail administration,
- b) By adding a new mailbox in this system and cycling system power.

If a mailbox is to be removed it must be done through Voice Mail administration.

If a station that does not have an associated voice mailbox, calls the Voice Mail system they will be answered by the Voice Mail system main greeting.

NOTE: Groups 514/5019 cannot be assigned mailboxes as these are the VM groups. Mailboxes that are needed for people that do not have an extension must be added through Voice Mail programming.

MMC: 743

AUTO RECORD

DESCRIPTION:

This MMC is only used for the Samsung embedded Voice Mail.

Some specific stations in the phone system can be assigned to automatically record conversations. When this option is set, all incoming, all outgoing, or all calls (incoming or outgoing) can be recorded.

When this option is selected a specific port should be assigned for each station set to automatic conversation recording or the effectiveness of this feature cannot be guaranteed.

In this MMC you can assign:

1. Which stations use this feature. – Station number
2. What mailbox the conversation is recorded in. – Mailbox number
3. What type of conversations are recorded, in, out or both. – I, O or B
4. What port is dedicated to the station. – Voice mail port number

The maximum number of stations assigned the AUTO RECORD feature is limited to the maximum number of voicemail ports. Each station using AUTO RECORD depletes Voice Mail/Auto Attendant ports by one.

The same port cannot be assigned to more than one station. Attempts to do this will result in an error message.

When a Voice Mail port is assigned here, it is automatically removed from the Voice Mail group (519) defined in MMC 601.

WARNING: Before using this feature make sure that you are not violating any state or federal laws. Some states require that the recorded party be notified. SAMSUNG is not responsible for any illegal use of this feature.

VM ALARM

DESCRIPTION:

This MMC is only used for the Samsung embedded Voicemail.

This MMC will generate an alarm message in the mailbox defined in MMC 745 whenever the Voicemail disk drive reaches this threshold.

The threshold is measured in % full. This means that if the MMC is set for 80, the alarm will be generated when the disk exceeds 80% of the available drive space. The end user should be instructed to delete old messages to recover disk space.

ASSIGN VM MOH

DESCRIPTION:

This MMC is used to assign each port a Music on Hold source for the OS 7100.

The 100 available sound files are defined as numbers 5000 to 5099. If you want to use default voicemail support music, select one of these numbers. Otherwise, make sure you record the sound file first. The next step is to assign the sound file to a port. For example, if you record sound file 5025 you would associate 25 with a specific voicemail port, e.g. 225. This will dedicate the port for use only as MOH and remove it from group 529 or 549. Now 225 will show up as a valid music source in MMC 308, 309 and 408.

Each Music on Hold source assigned here requires one voicemail port. Voicemail port is used for VM MOH, it must be disabled before boot up since SVM and the phone system use port 1 during boot up to exchange critical information. For this reason we suggest you use the last port as VM MOH ports.

PROGRAM KEYS

CLI RINGING

DESCRIPTION:

This MMC is for Central Office lines using Caller ID services. It uses a table of 500 entries containing telephone numbers that are to be acted upon in one or more of the following ways:

1. **REJECT OPTION:** Matches the Caller ID number received on the incoming call to an entry in this table and assigns it to be rejected. The phone system will hang up on this call before it is answered. NOT FOR USE IN THE USA.
2. **PRIORITY QUEUEING:** Matches the Caller ID number received on this incoming call to an entry in this table assigns it a priority of 1~9 when it rings any station group. When the group is busy a PRI-1 will be placed ahead of the other caller waiting to be answered.
3. **DISTINCTIVE RINGING:** Matches the Caller ID number received on the incoming call to an entry in this table and assigns it to ring with a specific TONE for keysets or CADENCE for SLTs.

The CID Ringing table consists of 500 entries.

CLI: CID number to be received from the central office. Up to 16 digits may be entered.

REJ: CID call reject option. When this is set to YES, an incoming call with a CID number that matches the CLI field will be rejected (hang up) by the system. (NOT FOR USE IN USA).

PRI: CID priority option. There are 9 priority levels: priority 1 is the highest and priority 9 is the lowest. When calls into station group come in and group members are all busy, the system will assign a priority to the CID number so that calls from a high priority CID number will be placed at the front of the group queue. If this option is set to NO, the longest call that is placed at the group queue has the highest priority.

R1:XXX,R2:XXX, R3:XXX, R4:XXX, R5:XXX, R6:XXX

Ring plan and destination during each ring plan. The destination can be a station or a station group.

MMC: 759

TONE: Ring Tone options for a specific CID Number (NO, 1~8)

TONE OPTION

NO	Calls will ring with the phone users choice of ring frequency.
1~8	Calls from the programmed CID number will ring phones with this ring frequency

CAD: Ring Cadence options for a specific CID Number at SLT's (NO, 1~5)

CADENCE OPTION

NO	Calls will ring with the normal SLT's ring cadences.
1	Calls from the programmed CID number will ring SLT's with the intercom ring cadence.
2	Calls from the programmed CID number will ring SLT's with the CO ring cadence.
3	Calls from the programmed CID number will ring SLT's with the DOOR ring cadence.
4	Calls from the programmed CID number will ring SLT's with the ALARM ring cadence.
5	Calls from the programmed CID number will ring SLT's with the CALLBACK ring cadence.

MMC: 805

LEVEL & GAIN

DESCRIPTION:

Allows the system administrator to set the base level of the TX volume on keysets system wide. There are eight (8) levels those are able to be controlled by the VOL UP and DOWN key on keyset. And maximum controllable levels in the system are ten (10). Keyset station users can vary eight levels. So this MMC gives the most flexibility to the system administrator so he can classify any desired eight(8) levels within eleven (11).

NOTE: This MMC should not be changed from the default levels without the assistance of the STA technical support department

0	TX LEVEL CONTROL	Adjusts the transmitting sensitivity (Max. : 9) INDEX : 0 1 2 3 4 5 6 7 LEVEL : 0 1 2 3 4 5 6 7
1	MISC TSW GAIN	Adjusts the level of the internal music source of the MCP card or the external music source of the MISC card.(0~7, higher numbers mean lower levels)
2	TSW GAIN CONTROL	Adjusts the tone sensitivity (As shown below, there are 25 types of connections of the T-Switch that adjusts the tone sensitivity. Connection between C.O. lines are only applicable when set as 0 in Program 418.)

0	0	DGP DGP	Adjusts sensitivity from digital phone Tx to digital phone Rx
	1	DGP SLT	Adjusts sensitivity from digital phone Tx to normal station Rx

MMC: 806

CARD PRE-INSTALL

DESCRIPTION:

Allows the preprogramming of a card slot for a specific board type. A board inserted into a OfficeServ 7100 system will not be recognized by the system until it is ENABLED using this MMC. Cards installed using MMC 806 will NOT be assigned in the system numbering plan. You must then use MMC 724 to assign the desired directory numbers to extensions or trunks ports.

NOTE: If a card is removed and a different type card is inserted and this MMC is performed, the memory associated with that card (i.e. key programming, etc.) will be erased.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC

ACTION

DISPLAY

1. Press TRANSFER 806.
 Display shows.

```
C: 1 - S:1
UNI-DDN->UNI-DST
```

2. Press the right soft key to move cursor to the "S" or slot position. Press the UP or DOWN key to advance the slot position, or use dial pad to make selection (eg. Change from DDN to DST) N=none, D=DLM, S=SLM, T=TRM)

```
C:1 - S:1
UNI-DDN->UNI-DST
```

3. Use the RIGHT softkey to make selection.

4. Use the dial pad (1=YES, 0=NO) to make selection.

```
C:1 - S:1
ARE YOU SURE?
```

5. Press the UP or DOWN key to advance the SLOT position. Now the display will show the daughter slot of the MP10 card.
 D=DLM, W=SWM, N=NONE

```

RESET SYSTEM

DESCRIPTION:

Provides three methods of restarting the system. The first method restarts the system and clears all memory. The second method (fast restart) restarts the system only. The third method restarts the system but does not reload the software from the MMC+ card. If clear all memory is selected, only the default data will return. Extreme care should be taken when using this MMC. If the system is restarted, all voice/data connections are dropped. If memory is cleared, all customer data is deleted and the system returns to defaulted status. When memory is cleared, MMC 830 IP address information is still retained. [IMPORTANT: See Section 1.4 DEFAULTING THE SYSTEM.](#)

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right

ACTION

1. Press TRANSFER 811.
Display shows.
2. Press UP or DOWN key to make selection.
After selection is made, press RIGHT soft key to move cursor to YES/NO option.
3. Press UP or DOWN key to make selection and press RIGHT soft key.
4. Press UP or DOWN key to make selection and press RIGHT soft key.
This erases all data in the system
5. System will return with default time and date and default extension number
OR If system just restarted, it will return to normal programmed status.

SET COUNTRY

DESCRIPTION:

(NOT USED IN USA)

This program allows the user to change the country version of the system software.

Programming is possible without setting ENABLE in Program 800 Set Technician Program Mode. In this case, the user must enter the technician program passcode.

Note: System restarts when the current country version is changed, and all data is initialized according to the new country version.

Caution: Version is designed to conform to the country's standards. Therefore, contact your Customer Support Center for specialized assistance when using "Program 812 Change Program Country Version."

PROGRAM KEYS

MMC: 815 CUSTOMER DATABASE COPY

DESCRIPTION:

Provides a means to copy the customer database to the media card (MCDB). This enables the on board database DRAM (SYSDB) to be copied to the MMC+ media card (MCDB) and also allows the MMC+ media database to be copied to the on board DRAM. A daily save can be programmed to automatically save the on board data base DRAM to the media card. This ensures that an up to date database is always available in the case of a catastrophic failure. A daily save time of 00:00 means there is no save performed. It is recommended to CLEAR the media card before the DRAM (SYSDB) is copied to it. When the DRAM is copied to the media card there is no interruption in service. If the media card is copied to the DRAM (SYSDB) the system will reset to accept the new data. **IMPORTANT: See Section 1.3 SYSTEM MEMORY MANAGEMENT for details.**

DATABASE IDENTIFICATION

MCDB	OfficeServ 7100 MMC+ card database
SYSDB (DRAM)	OfficeServ 7100 MCP On-Board database
S:mm/dd/yy hh:mm	Indicates the time the database was saved to the media card or the time the On-Board Database was last saved.
DAILY SAVE hh:mm	The time the On-Board Database (DRAM) will be saved to the media card (MCDB)

CONFERENCE GAIN

DESCRIPTION:

Provides a tool to adjust the gain or loss of stations and trunks in the conference bridge. This is made available to allow for the adjustment of the conference bridge due to permanent unsatisfactory C.O. conditions that may inhibit a satisfactory conference bridge. Programming adjustments can be made on individual conference analog trunk members.

Caution!! This MMC is not to correct low volume. To be used with the support of STA Technical Support Department.

IDENTIFICATION

MEMBER: This identifies which size of conference the adjustment will be made for. ie. 3,4 or 5 party conference.
A-TRK: This identifies which analog trunk member that is being addressed.
CNF: This is the gain or loss adjustment in the conference bridge.
SW: This is the gain or loss adjustment in the time division switch.

ASSIGN SYSTEM LINK ID

DESCRIPTION:

This MMC is used to assign the system link ID for Q-sig and VoIP networking. In addition each Link ID is also associated with the IP address of the MCP card for that system for use when IP networking is used to connect to that system.

OPTION	DESCRIPTION
LINK ID	System ID used for networking. Unique ID is assigned for each node in the network. Note: "Node" refers to the OfficeServ 7000 Series in the network.
SIGNAL G/W	IP address for each node in the network. The IP address assigned to the MCP in MMC 830 is used.
IP TYPE	Public or private type is assigned to each node for 'SELF'. The IP TYPE assigned in MMC 830 is applied.

PROGRAM KEYS

VIRTUAL STATION TYPE

DESCRIPTION:

This MMC determines the type of telephone, SLT or keyset model, that a virtual port will emulate. The virtual ports can be set to emulate SLT ports, DCS sets, iDCS sets, DS sets or ITP sets. The ports cannot be made to emulate AOMs or 64 button modules.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry
ANS/RLS	Used to select ALL

ACTION

1. Press TRANSFER 822.
Display shows.
2. Dial station number (e.g., 3505)
OR
Press UP or DOWN to select station and press RIGHT soft key to move cursor.
3. Press LEFT or RIGHT soft key to return to select telephone type. Press UP or DOWN soft key to change telephone type. Press LEFT or RIGHT soft key to return to Step 2.
4. Press TRANSFER to store and exit
OR
Press SPEAKER to store and advance to next MMC.

DISPLAY

MMC: 823

NETWORK COS

DESCRIPTION:

This MMC is used to create new networking COS or change the default values of an existing COS. This allows for multiple, different COS to be used. There are 30 network classes of service available. These classes of service follow the COS assignments in MMC 301.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to delete an entry

ACTION

1. Press TRANSFER 823.
Display shows.
2. Press UP or DOWN key to select COS and
press RIGHT soft key to move cursor.
3. Press UP or DOWN key to select option.
Press RIGHT soft key to move cursor.
4. Press UP or DOWN key to select YES
or NO.
Press RIGHT soft key to make change and
return to Step 2.
5. Press TRANSFER to store and exit
OR
Press SPEAKER to store and advance to next
MMC.

```

MMC: 823

These are the selectable options:

01 – CALL OFFER: Enables a call to be offered to a busy called user and to wait for that called user to accept the call, after the necessary resources have become available. The busy called user is given an indication of the offered call. During the time that the call is offered, the called user may ignore the offered call or may attempt to make the necessary resources available (e.g. by releasing or placing on hold another call). When and if the necessary resources become available, the call shall be completed as a normal incoming call.

04 – CC SIG CONN: There are two ways in which Callback features controls signaling connections:

YES = connection retention method – the signaling connection is maintained until completion or cancellation.

N) = connection release method – the signaling connection is cleared after each phase of call independent signaling and a new signaling connection is established for each subsequent phase of call independent signaling.

05 – CC SVC RETN: There are two possible behaviors when User B is found to be busy again after User A responds to callback recall:

YES = service retention method – the CC Request remains in force at the Originating and Terminating nodes and the Terminating node commences the monitoring of User B again;

NO - service cancellation method – the Callback Request is cancelled at the Originating and Terminating nodes.

06 – CCBS: Completion of Calls to Busy Subscribers. This enables the Call Back feature over the network. YES – Callback enabled and NO = Callback disables. *Not available on QSIG over PRI networking.*

07 – CCNR: Completion of Calls on No Reply is a supplementary service which is offered to a calling User A. On encountering a called User B which does not answer, it allows User A to request that the PISN monitors User B and notifies User A when User B becomes free after a subsequent period of activity. On response by User A to that notification the PISN shall attempt to complete the call to User B.

08 – CFB: Call Forward Busy (CFB) enables a served user to have the node redirect to another user calls which are addressed to the served user's PISN number and meet busy. SS-CFB may operate on all calls or just those associated with specified basic services. The served user's ability to originate calls is unaffected by SS-CFB.

MMC: 823

09 – CFNR: Call Forward No Reply (CFNR) enables a served user to have the PISN redirect to another user calls which are addressed to the served user's PISN number and for which the connection is not established within a predefined period of time. The served user's ability to originate calls is unaffected by CFNR.

10 – CFU: Call Forward Unconditional (CFU) enables a served user to have the node redirect to another user calls which are addressed to the served user's node number. CFU may operate on all calls or just those associated with specified basic services. The served user's ability to originate calls is unaffected by CFU. After CFU has been activated calls are forwarded independently of the status of the served user.

11 – CI: Call Intrusion (CI) is a supplementary service which, on request from the served user, enables the served user to establish communication with a busy called user (user B) by breaking into an established call between user B and a third user (user C). On successful intrusion, user C is either connected in a conference type connection with the served user and user B or disconnected from user B (isolated).

12 - CI CAPABIL: Intrusion Capability Level (1 ~ 3): An intrusion request is only accepted if the served user has a higher Call Intrusion Capability Level (CICL) than the Call Intrusion Protection Level (CIPL) of both user B and user C.

14 – CI PROTECT: Intrusion Protection Level (0 ~ 3) Refer to the above 12.

23 – CONP LEVEL: The calling user can be provided with the name identification information according to the CONP level, CONP Level (0 ~ 3).

26 – CT RE-ROUTE: Transfer By Rerouting (CT) is a supplementary service which enables a served user (User A) to transform two of that users calls into a new call between the other two users of the two calls (User B and User C). Each call can either be an incoming call to User A or an outgoing call from User A. After successful invocation of CT, User B and User C will no longer be able to communicate with User A.

27 – DND TONE: DND Announcement. As an implementation option, it may be possible for the served user to select a tone or announcement to be given to the calling user on invocation of DND.

28 – DNDO: Do Not Disturb Override (DNDO) is a supplementary service which enables a calling user to override DND at a called user, allowing the call to proceed as if the called user had not activated DND.

MMC: 823

29 – DNDO CAPABL: DNDO Capability Level (0 ~ 3) The subscription parameter “DNDO Capability Level” (DNDOCL) shall be provided. The DNDOCL has a value in the range 1 (lowest capability) to 3 (highest capability). At least one of the DNDOCL values shall be offered.

30 – DNDO PROTEC: If DNDO Protection Level (1 ~ 3) is implemented then the subscription parameter “DND protection level” (DNDPL) shall be provided. The DNDPL has a value in the range 0 to 3 where 0 means no protection against DNDO and 3 means total protection against DNDO. The values 0 and 3 shall be offered. The values 1 and 2 may, as an implementation option, be offered.

31 - PAGE.: This feature allows station users in one node to initiate network pages to other page zones to different nodes in the network.

32 - PATH REPL.: Path Replacement (PR) is invoked by an ANF-PR user for an established call, allowing that call’s connection through the network to be replaced by a new connection. The direction of the new connection may be decided by the PR user. If the new connection is required to satisfy certain criteria, PR should be used in conjunction with other supplementary services.

33 - PATH RETEN: Path Retention -the retention of the network connection between the Originating and Terminating nodes so that a supplementary service (such as DNDO) can be invoked without establishing a new connection.

NETWORK DIAL PLAN

DESCRIPTION:

This MMC is the translation table that defines the extension dialing plan for the networked systems.

PROGRAMMED FIELD DESCRIPTIONS: PP:NONE → DDDD
SZ:X MAX:XX MB:XX

PP Dial Plan Number (01-99).
DDDD Link ID and leading digits for the extension numbers in that switch (8 characters maximum).
SZ Number of digits in extension number (0-9).
MAX Number of digits total (1-20) for ID number and extension number.
MB Create mailbox for this extension range in this switch (Y/N).

PROGRAM KEYS

UP & DOWN Used to scroll through options
KEYPAD Used to enter selections
SOFT KEYS Move cursor left and right

ACTION

1. Press TRANSFER 824.
Display shows.
2. Press UP or DOWN key to select plan number and press RIGHT soft key to move cursor.
3. Enter LINK ID and FIRST DIGIT of extension number using the keypad and press RIGHT soft key to move cursor.
4. Enter number of digits in the extension number. Cursor advances to next field.
5. Dial maximum number of digits. Cursor advances to next field.

DISPLAY

MMC: 825**NETWORK OPTIONS****DESCRIPTION:**

When you have networked switches, this MMC is used to set the network related options for Caller ID and Voice Mail.

These are the options:

0	ADD NUMBER TO NAME	Assign to include the extension number in the name field of Q-SIG standard message.
1	USE REMOTE VM	Assign to use SVM on remote system.
2	REMOTE VM NUMBER	Assign to access number of remote SVMi when Remote VM is used.
3	REMOTE CID NUMB	Assign to use delete node number when CID number send to SVMi.
4	USE REMOTE ATTN	Assign to use Attendant on remote system.
5	REMOTE ATTN NUMB	Assign to access number of remote attendant when the remote attendant is used (one access number per ring plan).
6	SPNET SEND DIGITS	<p>When IP networking systems, this option determines the method used for sending digits between nodes.</p> <ul style="list-style-type: none">• MGI Signalling: follows the "DTMF TYPE" setting in MMC 835 (inband or out of band) for signaling between nodes.• MCP Signalling: MCP sends IPC messages to MCPs in other network nodes over IP with digit information. MGI is not involved. This does <u>not</u> apply to analog devices sending digits across the network (i.e. SLT)

MMC: 829 LAN PRINTER PARAMETER

DESCRIPTION:

This program sets the various parameters required for printing to a LAN connected device (PC or printer).

The eight types of data listed below can be displayed using the LAN printer or PC.

REPORT	LAN TCP PORT (TCP port of MCP providing the service)
[01] SMDR	5100
[02] UCD REPORT	5101
[03] TRAFFIC REPORT	5102
[04] ALARM REPORT	5103
[06] PERIODIC UCD	5105

Ports 5100 ~ 5106 are fixed and are displayed in the "LAN TCP" field below.

The items that are set in this program are listed below.

00	DATA TYPE	Type of data to be displayed (01~06 above)
01	CURR STATUS	Current status of the LAN printer (READ ONLY FIELD) When "DESTINATION" is PC, this field will display "OFF" until PC is connected.
02	EMPTY BUFF	Prints all data left in the buffer
03	UPDATE LAN	Applies modified items When making any TCP/LAN related parameter, select "YES" to update LAN (and save) for changes to take effect.
04	DESTINATION	Select the device where your report prints.
05	PRINTER IP	Sets the IP address of the LAN printer
06	PRINTER TCP	Enter TCP port of printer (see printer manufacturer specifications)
07	LAN TCP	Displays LAN TCP port of the associated service shown in table above (READ ONLY)
08	RETRY COUNT	Retransfer attempt count (00~10)
09	RETRY WAIT	Wait time for retransfer(005~250 sec)
10	PJL ENABLE	Sets PjL (0. FALSE, 1. TRUE)
11	LANGUAGE	Printer language(0. RAW, 1. PCL, 2. PS)
12	PAPER SIZE	Paper size (0. A4, 1. LETTER)
13	FONT TYPE	Font type (0. COURIER, 1. TIMES NEW ROMAN)

MMC: 829

14	DUPLEX ENAB	Sets duplex (0. FALSE, 1. TRUE)
15	ORIENTATION	Sets orientation (0. PORTRAIT, 1. LANDSCAPE)
16	PRINT TRAY	Sets printer tray (0. DEFAULT, 1. TRAY 1, 2. TRAY, 3. MANUAL)
17	RESOLUTION	Resolution (0. 300, 1. 600)
18	LINE/PAGE	Line per page

PROGRAM KEYS

MMC: 830 ETHERNET PARAMETERS

DESCRIPTION:

This MMC provides the means to configure the Internet Protocol (IP) addressing of the OfficeServ 7100 system MP10 card. This MMC must be utilized if there are ITP series phones and/or MGI cards used on the system. Even without any VoIP applications you still have to configure the MP10 IP for LAN based OfficeServ 7100 box connections.

- NOTE: When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- PLEASE ALSO NOTE: The first 3 parameters: *SYSTEM IP ADDR*, *SYSTEM GATEWAY*, and *SYSTEM NET MASK* are stored separate from the main system database, thus will not be defaulted when MMC811 "CLEAR MEMORY" is performed. Furthermore, any changes to these parameters will not be applied until the MP is reset.
- **SYSTEM IP ADDR:** Specifies the IP address for the MP10 card.
- **SYSTEM GATEWAY:** Specifies the designated LAN gateway IP address used for contacting IP devices beyond the local network subnet.
- **SYSTEM NET MASK:** Specifies the IP subnet mask. This parameter is used by the system to calculate the range of IP devices (subnet) that are within "direct reach" of the MP10 (without having to go through the designated network IP gateway).
- **SYSTEM RESET:** Prompt to restart system MP10 when system IP address is changed. This reset is similar to MMC 811. You must use this reset for any changes in this MMC to take effect.
- **SYSTEM IP TYPE:** Defines which IP addressing relationship is used for communications to and from the MP10 card.
 - PRIVATE IP ONLY – the system assumes all ITP/VOIP devices are on the same network. Traffic involving non-IP based devices (such as analog trunks, digital keysets, voicemail, etc.) are handled VIA the MGI card.
 - PRIVATE w PUBLIC – the system knows that there is a mixture of ITP/VOIP devices on the same network and on remote network(s), thus communicates accordingly based upon the entries in MMC 840 (for ITP phones) or MMC 838 (for other MP10).

MMC: 830

- Public IP Only – use when MP10 IP address is exposed to the public network.
- **SYSTEM PUBLIC IP:** The MP10 will originate communications, to ITP/VOIP devices outside the local network, using this IP address. Communications to/from this IP will require involvement of the MGI resources. The system identifies communications to/from this address as “public”. This allows devices, on remote networks/subnets, to establish communications with the system, without exposing your LAN. [See “SYSTEM IP TYPE.”](#)
- **SYSTEM MAC ADDR:** For your reference, and cannot be changed. The unique hardware (MAC) address of the MP10 card.
- **PCMMC ADDRESS:** *No entry required. Reserved for future use.*
- **SM MANAGER IP:** *No entry required. Reserved for future use.*
- **NEWS ADDRESS:** *No entry required. Reserved for future use.*
- **CTI SERVER ADDRESS:** *No entry required. Reserved for future use.*
- **MMS SERVER IP:** *Reserved for future use.*
- **MMS WEB SERV IP:** *Reserved for future use.*

MMC: 831

MGI PARAMETERS

DESCRIPTION:

This MMC only applies to MGI-16 cards installed in the system.

NOTE: If you only have the MP10 on-board MGI ports this becomes “READ ONLY” MMC since it has the same values as the MP10.

This MMC provides the means to configure the Internet Protocol (IP) addressing of the OfficeServ 7100 system MGI resources and hardware. This MMC must be utilized if there are ITP series phone(s) and/or MGI card(s) used on the system (or if the on-board MGI ports are enabled via licenses).

NOTE: This MMC cannot be accessed unless there is an MGI-16 card installed in the system or has MGI licenses enabled for the built-in MGI ports on the MP10.

- NOTE: When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- PLEASE ALSO NOTE: The first 3 parameters: *IP ADDRESS*, *GATEWAY*, and *SUB MASK* - changes to these parameters **will not be applied** until the MGI is reset, use the reset option below to reset the MGI.
- **IP ADDRESS:** Specifies the IP address for the MGI card. The MGI ports built-in to the MP10 will have the same IP address as the MP10.
- **GATEWAY:** Specifies the designated LAN gateway IP address used for contacting IP devices beyond the local subnet.
- **SUB MASK:** Specifies the IP subnet mask. This parameter is used by the system to calculate the range of IP devices (subnet) that are within “direct reach” of the MGI (without having to go through the designated network IP gateway).
- **IP TYPE:** Defines which IP addressing relationship is used for communications to and from the MGI card.
 - PRIVATE IP ONLY – the system assumes all ITP/VOIP devices are on the same network. Traffic involving non-IP based devices (such as analog trunks, digital keysets, voicemail, etc.) are handled VIA the MGI card.
 - PRIVATE w PUBLIC – the system knows that there is a mixture of ITP/VOIP devices on the same network and on remote network(s), thus communicates accordingly based upon the entries in MMC 840 (for ITP phones).

MMC: 831

- Public IP Only – use when MGI’s IP address is exposed to the public network.
- **PUBLIC IP:** The MGI will originate communications, to ITP/VOIP devices outside the local network, using this IP address. The system identifies communications to/from this address as “public”. This allows devices, on remote networks/subnets, to establish communications with the system, without exposing your LAN.
- **PUBLIC PORT:** This defines the UDP port range on the firewall forwarded to the MGI resources.
- **CARD RESET:** Use this option to reset the MGI. This option only applies to MGI cards installed on the system. It does not apply to the on-board MGI ports.

VoIP OUTBOUND DIGITS

DESCRIPTION:

This MMC is only used for Gateway to Gateway IP Trunking applications. This MMC provides the means to set the MGI internal numbering plan for digit dialing and conversion when using IP trunking application.

- **ACCESS DGT:** This is the access code that is used once the MGI is accessed; this directs a call based on the routing tables used. An access code table then references an access code and correlates an IP address to the access code for routing. A maximum of 8 digits are available with 63 access code entries (00~62).
- **DGT LENGTH:** This field requests the number of digits that are expected to be received to make up the whole access code.
- **DEL.LENGTH:** This is the number of digits to delete after receiving the access code.

NOTE: If no digits are deleted the access code will be sent as part of the call to the destination to continue routing at the far end destination.

- **INSERT DGT:** This is the digit(s) to insert for routing at the destination. This can be used when different numbering plans exist or if a dial 9 access is needed to be inserted in the dialed digits.
- **IP TABLE 1:** This is the first table referenced for routing the access code to an IP address. The system has 63 IP tables (00~62) with 16 entries (00~15) in each table.
- **IP START:** This entry indicates where in a table to start looking for an IP code to associate with the access code. This can be used to manage where to start looking for an IP address in high traffic MGI applications. Example: If IP address routing to the desired destination is known to be in the last 7 entries of a table the IP START location would be 8. IP address searching would start at entry 8.
- **SERVER USE:** This parameter determines whether a H.323 Gatekeeper (MMC836) will be utilized to establish this connection (0:no, 1:yes).

MMC: 833

VoIP IP ADDRESS

DESCRIPTION:

This MMC provides the IP addresses in tables pointed to by the VoIP code entry (MMC832). There are 63 tables with up to 16 entries each. The destination IP address is required to route dialed digits based on the access code and digits dialed. The IP entry field is divided into 4 sections allowing modification of separate IP address fields.

- NOTE: When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010

H.323 OPTION

DESCRIPTION:

This MMC is used for H.323 IP Trunking configuration. This MMC provides various VoIP support options. The options set in this MMC are set systemwide.

- **GATEWAY CALL ID:** This a 1 to 12 digit numeric entry that identifies this system.
- **H.323 FAST SETUP:** Enables or disables the H.323 Fast Start call setup method.
- **CALLER ID TYPE:** This option controls the calling party identification type. There are 3 possible selections: *ANI* which shows the calling station number when the call is an MGI to MGI, *IP* which shows the calling MGI IP address, and *GWID* which is a 1 to 12 digit preprogrammed ID.
- **TUNNELING:** Enables or disables the need for additional channels using H.245 signaling. Tunneling allows use of the H.245 signal channel with the Q.931 channel.
- **DEFAULT DIL NO.:** This allows programming of the default DIL number when digits are missing, or incorrect on an inbound call.
- **CODEC AUTO NEG:** Enables or disables Auto CODEC Negotiation when the MGI is used as a trunking gateway. This parameter is set as ON or OFF.
- **SIGNAL PORT:** Indicate the port number for H.323 signaling and sets a range of numbers allowed by firewall equipment. The common/default IP path or port used is 10000. When using the MGI as a trunking gateway the formula for which ports to open depends on the number of VoIP channels. The formula is as follows: $\text{base signaling port (10000)} + 128 + 2 * (\# \text{ of VoIP ports} - 1) + 1$.
- **SEND CLIP TABLE:** Refers to SEND CLI NUMBER (MMC 321), which provides calling party identification when using the MGI as a trunking gateway. This provides station ID of the calling station. A single digit value corresponding with the desired table in MMC321 should be entered here. This is only used when MMC 405 value is null. Default 1.
- **INCOMING MODE:** This option selects how incoming calls are routed: FOLLOW DID TRANS [default] (MMC 714), FOLLOW TRUNK RING (MMC406),

MMC: 834

or FOLLOW INCOM DGT (MMC 724) when the MGI is used as a trunking gateway.

- **ALLOW GW CHECK:** When using a gatekeeper, this permits the MGI to check for gatekeeper presence. This parameter is set as ENABLE or DISABLE

MMC: 835

MGI DSP OPTION

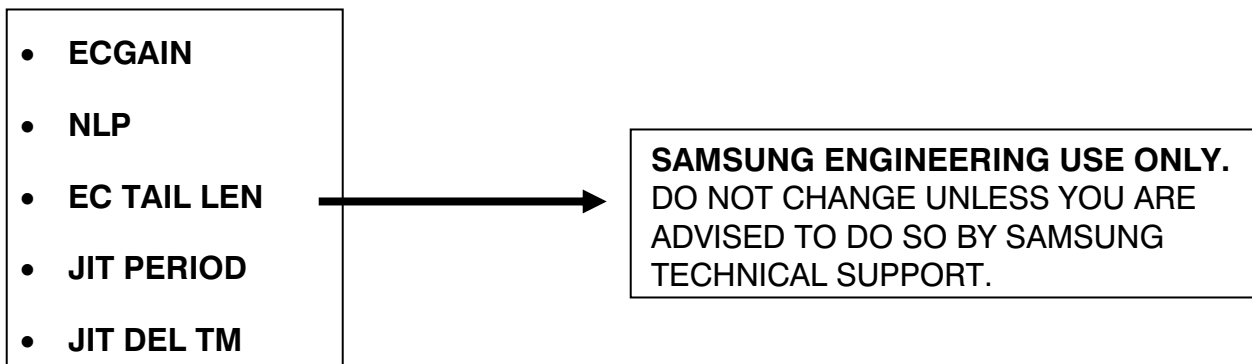

DESCRIPTION:

This MMC provides various MGI DSP options. These settings will apply to the 8 MGI channels on board plus any MGI-16 installed in the system.

- **AUDIO CODEC:** Selects which audio codec compression will be used and transmission interval time of VoIP packets generated from MGI card. Selections: G729A (8K), G.729 (8K), G.711 (64K), G.723.1 (5.3K~6.4K). Does not apply to ITP to ITP communications. Use settings in MMC 840/MMC 841 for ITP to ITP communications.
- **ECHO CANCEL:** Enables or disables echo cancellation (0: disable, 1: enable). This function removes echo that is generated by voice reflection and packet delay.
- **SILENCE SUP:** This parameter determines whether silence suppression is used (0: disable, 1: enable). This prevents transmission during the silence period of a call, and conserves bandwidth when enabled.
- **IN FILTER:** This option select input filtering of the DSP (0: disable, 1: enable). This should always be set as ENABLE.
- **OUT FILTER:** This option select output filtering of the DSP (0: disable, 1: enable). This should always be set as ENABLE.
- **INPUT GAIN:** PCM input gain value of DSP. The range is -31dB~31dB (0~63). This sets the quality of PCM voice from the VoIP DSP to the site.
- **VOICE VOL:** This value selects the voice volume. The range is -31dB~31dB (0~63).
- **JITTER OPT:** This is a scale value that introduces a intentional buffer (delay) of the transmission of VoIP packets generated by the MGI card. This value determines whether the focus is on packet loss or packet delay. The range is 00~12.
- **MIN JITTER:** Decides the minimum time to consider delay for jitter adjustment. The range is 010~300ms.
- **MAX JITTER:** Decides the maximum time to consider delay for jitter adjustment. The range is 010-300ms.

MMC: 835

- **FAX ECM:** This option enables or disables fax error-correction mode (0: disable, 1: enable).
- **MAX FAX CNT:** This is maximum number of channels that can be *simultaneously utilized* for Fax-over-IP. The range is 00~08. Each MGI-16 can handle 2 simultaneously.
- **DTMF TYPE:** There are two types of DTMF transmission: INBAND, which is industry standard (H.245) type DTMF transport, and OUTBAND which is a Samsung proprietary method.
- **TOS/DIFFSERV:** An eight-bit binary value that will be utilized by external routers, switches, etc (*that optionally support TOS-bit/DiffServ prioritization*) – to identify the transport-priority value of data packets generated by the MGI card. This value can be left at default value (00000000) if your network infrastructure does not support this method of bandwidth management.
- **FAX RETRY:** The number of attempts to resend a failed fax transmission.
- **RTP CHECK TIME:** Interval between RTCP packets sent from MGI cards.
- **USE T.38 711:** Implements the T.38 fax over IP protocol when using G.711 codec.
- **802.1q:** Enables/disables VLAN tagging on the MGI resources.
- **802.1 PRIORITY:** Assigns a priority to the VLAN tag.
- **802.1 Q VLAN:** Assigns a VLAN ID to the MGI.

Note: Does not apply to ITP to ITP calls (where both ITP's are in same public zone, or both in same private zone). For ITP to ITP calls, use settings in MMC 840/MMC 841.

H.323 GK OPTION

DESCRIPTION:

Provides a means to set the MGI parameters for an optional external industry-standard H.323 network gatekeeper, using Registration, Admissions, and Status signaling (RAS). The settings are system wide.

- **NOTE:** When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- **GK CONNECTION:** This determines if the MGI is to connect to a gatekeeper. The options are: ENABLE or DISABLE.
- **GK ROUTING:** This enables or disables routing of calls through a gatekeeper. The options are: ENABLE or DISABLE.
- **GK IP ADDRESS:** This is gatekeeper's IP address.
- **GK NAME:** This is alphanumeric name identifier of the gatekeeper. An entry of 9 characters with a space followed by an additional 6 alpha-numeric characters.
- **ALTER GK IP ADDR:** This provide for an alternate gatekeeper address.
- **H.323 GATEWAY ID:** This is the H.323 identifier used by the MGI when registering with the gatekeeper. This can be up to 16 characters in length.
- **E.164 GATEWAY NO:** This is the E.164 identifier used by the MGI when registering with the gatekeeper. This can be up to 16 digits in length.
- **GK KEEP ALIVE:** This is the timer that the MGI uses to acknowledge the presence of the gatekeeper. The range is 000~999 seconds.
- **GK DOWN ROUTE:** This provides an alternate route in case the primary gatekeeper is down. Selections are PSTN or ALTER GK.
- **GK RAS TYPE:** Select if AUTO or MANUAL, depending on your gatekeeper's capabilities.
- **URQ REASON MODE:** Select ON or OFF for usage of Unregister Request RAS (URQ) messages.

MMC: 836

- **RRQ FAIL TIME:** Programs the time frame to re-send Registration Request RAS (RRQ) messages to a gatekeeper. Default is 30 seconds. The range is 1~99.
- **GRQ SEND:** Select ON or OFF for usage of Gatekeeper RAS Request (GRQ) messages.
- **USE MULTI E.164:** When set to “Enable” the E.164 identifier can be assigned to multiple lists (32 max).
- **E.164 LISTS (1):** This is the E.164 identifier used by the H.323 trunk when registering with the gatekeeper (max 32 lists with 16 digit string length).
- **GK REGISTERED:** Displays GK registration status.

SIP OPTIONS

DESCRIPTION:

This MMC permits the adjustments of optional Session Initiation Protocol (SIP) trunking parameters. The MGI supports SIP Trunking on a per call-per-port basis. The settings are systemwide.

- **NOTE:** When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- **GATEWAY CALL ID:** This a 1 to 12 digit numeric entry that identifies this system.
- **CALLER ID TYPE:** This option controls the calling party identification type. There are 3 possible selections: *ANI* which shows the calling station number when the call is MGI to MGI, *IP* which shows the calling MGI IP address, and *GWID* which is a 1 to 12 digit preprogrammed ID.
- **DEFAULT DIL NO.:** This allows programming of the default DIL number when digits are missing, or incorrect on an inbound call.
- **UDP PORT: TRUNK:** Sets the UDP port used on a trunk call.
- **UDP PORT: PHONE:** Sets the UDP port used on a SIP phone call.
- **RE-TRANS. T1 TIME:** The initial re-transmission time if no answer based on the RFC2543 specification. Default 500ms. The range is 0~9900.
- **RE-TRANS. T2 TIME:** The maximum re-transmission time if no answer based on the RFC2543 specification. Default 4000ms. The range is 0~9900.
- **RE-TRANS. T4 TIME:** The time the User Agent Server waits after receiving the ACK message. Based on the RFC2543 specification. Default 5000ms. The range is 0~9900.
- **GENERAL RING TM:** The server shall retransmit the response during this amount of time until the requested retransmission is received. For example, the wait time after sending 200 OK for INFO. The range is 0~99900.

MMC: 837

- **INVITE LING TM:** After the client sends ACK for the INVITE Final Response, the client cannot confirm if the server received the ACK message. The client waits for this amount of time after sending ACK for the Final Response. The range is 0~99900.
- **PROVISIONAL TIME:** After receiving the Provision Response, the User Agent shall wait for this amount of time until Timeout ends. The range is 0~999900.
- **INV.NO RESP TIME:** Before sending Cancel for the Invite Request, the User Agent shall wait for this amount of time. The range is 0~99900.
- **GEN.NO RESP TIME:** Before sending Cancel for General Request, the User Agent shall wait for this amount of time. The range is 0~99900.
- **REQ.RETRY TIME:** After sending General Request, the User Agent shall wait for the Final Response for this amount of time. The range is 0~99900.
- **SIP SERVER ENBLE:** *ENABLE* or *DISABLE* to use an optional external industry-standard SIP Server.
- **SIP SERVER IP:** Sets SIP server IP address.
- **SIP SERVER PORT:** Sets the port to use on the SIP Server.
- **SIGNAL PORT:** Indicate the port number for signaling and sets a range of numbers allowed by firewall equipment. The common/default IP path or port used is 10000
- **SEND CLIP TABLE:** Refers to SEND CLI NUMBER (MMC 321), which provides calling party identification when using the MGI as a trunking gateway. This provides station ID of the calling station. A single digit value corresponding with the desired table in MMC 321 should be entered here. This is only used when MMC 405 value is null.
- **INCOMING MODE:** This option selects how incoming calls are routed: FOLLOW DID TRANS [default] (MMC 714), FOLLOW TRUNK RING (MMC 406), or FOLLOW INCOM DGT (MMC 724) when the MGI is used as a trunking gateway.
- **REGISTER T-GW:** Trunk gateway number to register STP server.
- **ALLOW GW CHECK:** Enable the check for the presence of a gateway.
- **SIP REGISTERED:** Displays registration status to the SIP server. (READ ONLY)

MMC: 837

- **GW SERVICE (PER USER):** If enabled, uses separate user login per station to the SIP server. If enabled you must use MMC 839 to enter each user name/password.
- **GW DOMAIN NAME:** (Optional) domain name of SIP Server.
- **GW USER ID:** User ID for SIP account on SIP registrar.
- **REGISTER PSWD:** Password for SIP account on SIP registrar.

MMC: 838

PRIVATE IP ADDRESS

DESCRIPTION:

This optional MMC provides a means for the MP10 to communicate with remote VoIP gateways on a network consisting of a mixture of private and public IP addresses. If your network consists of IP addressing that is *entirely* private OR *entirely* public, you do not need to utilize this MMC. There are 80 entries.

- NOTE: When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010

PROGRAM KEYS

UP & DOWN	Used to scroll through options

MMC: 839

SIP USER

DESCRIPTION:

This MMC is used for SIP Trunking applications where the SIP source requires registration on a “per-user” basis. This means that each station on the OfficeServ 7100 system that accesses SIP trunks (inbound or outbond calls) will require an unique user ID and password.

- NOTE: In order to use this MMC, you must set “GW SERVICE”=ENABLE in MMC 837.

If your SIP server does **not** authenticate on a per-user basis, then this MMC is **not** required.

Up to 100 (01~100) registrations can be entered.

1. Move cursor (using right soft key) to the registration number and use the volume up and down button to scroll through up to 100 users.
2. Press the right soft key to move the cursor to the “username” field and use volume up/down buttons to toggle between “username” and “password”. Enter the “username” (usually DID assigned to the station) and the corresponding password for each registration.

MMC: 840

IP SET INFO

DESCRIPTION:

This MMC provides a means to register the IP keyphones and softphone with the OfficeServ 7100 system. During registration, the IP and MAC addresses are also registered. The User ID and Password must match the table entry in this MMC for the IP keyphone to be registered. System default numbers start at 3201~3224. System default User ID's match the default station numbers. (3201~3224). The system default password is 1234. IP keyphones must be individually programmed with User ID and Password to register with the system.

- **NOTE:** When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- **USER ID:** This is the ID the IP keyphone must match to register with the OfficeServ 7100 system. This entry can be alphanumeric.
- **USER PSWD:** This is the Password the IP keyphone must also have to register with the OfficeServ 7100 system. This entry can be alphanumeric.
- **IP ADDR:** This is the IP address of the IP once registered with the OfficeServ 7100 system. View only.
- **MAC ADDR:** This is MAC address of the IP keyphone once registered with the OfficeServ 7100 system. View only.
- **SIG PORT:** Indicates the port number used for keyphone control signaling. This information will be needed when traversing NAT routers, firewalls, etc. View only.
- **VOICE PORT:** Indicates the port number used for transporting voice content. This information will be needed when traversing NAT routers, firewalls, etc. View only.
- **IP TYPE:** This is the type of IP network used where the ITP is located: PRIVATE or PUBLIC, or PUBLIC with FIREWALL. "PUBLIC with FIREWALL" option must be selected when there are firewalls/NAT routers between system and remote ITP's.
- **DSP TYPE:** This selects which CODEC this keyphone's DSP will use. G.729A (low bandwidth) or G.711 (high bandwidth). This applies to ITP to ITP communication only. ITP to TDM follows MMC 835.

MMC: 840

- **PHONE TYPE:** This the type of IP keyphone used. SAMSUNG or SIP (future). Please use SAMSUNG for the ITP series of keyphones.
- **REGIST CLR:** This is used to clear the registration of a particular IP keyphone. If a keyphone is relocated to a different physical subnet, it is very important that the keyphone registration is cleared and re-established with the proper IP information.
- **FRAME CNT*:** This is the sampling rate per frame. The lower the frame count the higer the bandwidth consumed per call. Range is 20 ms ~ 40 ms. Applies only to ITP calls.
- **JITTER BUFFER*:** This is the programmable time delay to buffer packets. Range 10 ms~90 ms. Applies only to ITP to ITP calls.
- **TOS/DIFFSERV*:** Allows the setting of Type of Service/Diffserv bits to allow precedence when using router that support this field. Applies only to ITP to ITP calls.
- **SW VERSION:** Software version of the particular ITP keyset. View only.
- **SW UPGRADE:** This is an IP phone software upgrade command. The TFTP server address must be programmed in MMC 841 for this to work. When selecting YES and pressing the right soft key, the selected ITP will be upgraded to software on TFTP server. MMC 841, "ITP version upgrade" must be set to MMC command.
- **TIME ZONE:** Sets the time off-set of IP phone from the system clock. This is used for IP phones on different time zones than the system. By adjusting this parameter the remote ITP phone's clock display will show local time of the time zone where it is located.
- **PUB TO PUB:** When set to "USE MGI" calls between two remote ITP phones located in the same private zone (or same public zone) will be forced to use an MGI channel. Select the "USE MGI" option if you encounter one-way audio or no audio between remote ITP phones.
- **PRIVATE IP:** Displays the private IP address (local IP) of the ITP phones (view only).
- **SIG TYPE:** Selects UDP or TCP protocol for ITP signaling.

Note: These settings are effective only if MMC 841, "ITP DSP PARA", DOWN=PHONE DATA.

MMC: 841**SYSTEM IP OPTION****DESCRIPTION:**

This MMC provides various proprietary Samsung VoIP/IP integration options. The options set in this MMC are system-wide.

No	Option	Description	Default
0	PHONE VERSION	Sets running IP-based phone and new phone software version with the system. For example if version is 2.05 enter 0205. The version must match the version of software loaded in TFTP server. LARGE DGP: Large LCD phone (not available in U.S.A.) LARGE ITP: Large LCD IP-based phone(ITP-5012L) 2LINE ITP: line LCD IP-based phone (ITP-5021D) WIPM APPL: Wireless IP-based mobile phone software. SOFT PC: Softphone Software SOFT PDA: Future ITP-5112L ITP-51xx (ITP-5107S, ITP-5121D) WIPM BOOT: Wireless IP-based mobile phone boot program. SOFT MENU: Soft menu version	0000
1	PHONE TFTP IP	Sets phone software upgrade TFTP server IP address.	0.0.0.0
2	ITP REGISTRATION	Defines the method that IP-based phones use to register themselves with the system.	-
		0 TYPE: Defines the method that IP-based phones use to registration themselves with the system. a) SYS PSWD: System will authenticate the IP-based phones with the value contained within parameter ITP REGISTRATION: PSWD within this same MMC. b) ITP PSWD: System will authenticate the IP-based phones according to entries made in MMC 840. c) DISABLE: System will not authenticate IP-based phones at all.	SYS PSWD
		1 PSWD: This is a system-wide password value used for registration of IP phones.	'1234'
3	EASYSET OPTION	Sets EasySet link via LAN option with the system.	-
		0 PSWD: This is a system-wide password value used for authentication of EasySet server.	'1234'

MMC: 841

		1 ALIVE TIME: This is a EasySet link via LAN alive check timer.	0 SEC
4	CTI LINK OPTION	Sets CTI link via LAN option with the system.	-
		0 SMDR REPORT: Sets YES or NO for SMDR data to CTI link via LAN.	NO
		1 UCD REPORT: Sets YES or NO for UCD data to CTI link via LAN.	NO
		2 ALIVE TIME: This is a CTI link via LAN alive check timer. If this sets 0, the system will not check link alive.	300 SEC
5	ITP DSP PARA	Sets IP phone DSP parameters of system-wide.	-
		0 M-FRAME: This value determines the transmission interval time of VoIP packets generated by the IP phone. This data is effective only when DOWN = SYS DATA in this MMC. The range is 10~40 ms. Applies only to ITP to ITP calls (when both ITPs are in same zone).	10 ms
		1 JITTER: Decides the minimum time to consider delay for jitter adjustment. This data is effective only when DOWN = SYS DATA in this MMC. The range is 10~90 ms. Applies only to ITP to ITP calls (when both ITPs are in same zone).	20 ms
		2 TOS/DIFFSERV: An eight-bit binary value that will be utilized by external routers, switches, etc(that optionally support TOS/DIFFSERV-bit prioritization)-to identify the transport-priority value of data packets generated by the IP phone. This value can be left at default value(00000) if your network infrastructure does not support this method of bandwidth management. This data is effective only when DOWN = SYS DATA in this MMC. Applies only to ITP to ITP calls (when both ITPs are in same zone).	all bits 0
		3 CONTROL: Determines data uses system-wide data or each phone data for IP-based phone DSP control. a) SYS BASE: System-wide data will be used.(MMC 841 data) b) ITP BASE: Each phone data will be used.(MMC 840 data) CODE C: Choose codec priority MGI or ITP.	SYS BASE
6	ITP TX GAIN/HSET	Sets IP-based phone Handset TX gain value of each level.	-
7	ITP RX GAIN/HSET	Sets IP-based phone Handset RX gain value of each level.	-

MMC: 841

No	Option	Description	Default
8	ITP TX GAIN/MIC	Sets IP-based phone MIC gain value of each level.	-
9	ITP RX GAIN/SPKR	Sets IP-based phone SPKR gain value of each level.	-
10	ITP VERS UPGRADE (“PHONE TFTP IP” and “PHONE VERSION” must be set).	Sets IP-based phone software upgrade option with the system. Used for automatic software upgrades.	-
		0 TYPE: Sets IP-based phone software upgrade type.. a) MMC COMMAND: IP-based phone software upgraded manually in MMC 840. b) PHONE CON: IP-based phone software upgraded automatically at phone connection. c) AUTO TIME: IP-based phone software upgraded automatically at set time.	MMC COMMAND
		1 START TIME: IP-based phone software automatic upgrade start time.	0000. (Disable)
		2 INTERVAL: IP-based phone software automatic upgrade interval time.	10 seconds.
11	MGI ALIVE PERIOD	Time interval between heart beat check between MGI and MP10.	-
12	FEATURE LICENSE KEY	Soft phone license key	NONE
13	FEATURE LICENSE STATUS	SOFTP ALLOW	0
		SOFTP USED	0
		SOFTP CONN	0
		NEWS ALLOW (not supported in US)	NO
14	DATACARD IPC	MP10 to data module IPC communication	YES
15	MP MGI/VM KEY LICENSE KEY	MGI License Key Entry.(For on-board MGI channels and voicemail).	BLANK
16	MP MGI/VM STATUS	MGI & VMS License Key Status: NO LICENSE KEY, MGI ALLOW: VMS ALLOW. Shows number of MGI channels and voicemail ports enabled by the license above.

MMC: 845**WLAN PARAMETERS****DESCRIPTION:**

This program provides detail parameters for WLAN settings.

<WLAN Parameter>

No.	Parameter	Description
01	CODEC LIST	CODEC used in a wireless VoIP call Currently it set to G.729
02	RF CHANNEL	RF Channels used in the system must match with APs.
03	VERSION	Indicates the WLAN module version
04	MAX AP CH	Maximum channel per AP
05	WLAN SWITCH	Enable or disable the use of WLAN switch

According to the AP type, CWBS is displayed if WBS24 is set to Combo, and BWBS if set to Basic on the LCD display. The AP type can be set in [AP TYPE] of [MMC 849].

<SIP Parameter>

Normally, use the default without change.

No.	Parameter	Description
1	GEN NO RESP	Waiting time before canceling the SIP Request.
2	INV NO RESP	Waiting time before canceling the SIP INVITE Request.
3	REQ RETRY	Waiting time before the final response to the SIP Request is received.
4	PROVISIONAL	When receiving the Provision Response, User Agent should wait during this time before Timeout expires.
5	RE-TRANS T1	When using Unreliable transmission protocol such as UDP, retransmission is performed if there is no response after transmission. RE-TRANS.T1 TIME is the Initial Retransmission Interval defined in RFC2543.
6	RE-TRANS T2	Maximum Retransmission Interval defined in RFC 2543.
7	RE-TRANS T4	Available for multiple purposes in RFC 2543. This parameter is used as time when User Agent Server(UAS) receives the ACK message and waits in the Unreliable transmission protocol.

MMC: 845

No.	Parameter	Description
8	GEN RING TM	In the Unreliable transmission protocol, it is not sure that the client receives a response after the server sends the last response. At this time, the server should retransmit a response during this time until it receives the requested retransmission. For example, it is the time to send INFO 200 OK and wait.
9	INV RING TM	In the Unreliable transmission protocol, it is not sure that the server receives the ACK message after the client sends INVITE Final Response ACK. It is the waiting time after the client sends Final Response ACK.

PRECONDITION

None

MMC: 846

WIP INFO

DESCRIPTION:

[MMC846] is used to display the handset information and set some parameters. You can change USER ID, PASSWORD, and INSERT DGT.

No.	Parameter	Description
0	REGISTERED	Indicates whether the corresponding handset is registered
1	LOCATED	Indicates whether the corresponding handset is currently connected to the system
2	PHONE TYPE	Indicates the type of the handset
5	IP OFFSET	Location of the IP pool where the IP assigned to handset is located
6	IP ADDRESS	IP address assigned to the registered handset
7	MAC ADDR	MAC address of the registered handset
8	USER ID	Sets ID by the handset user
9	PASSWORD	Sets password by the handset user
10	INSERT DGT	If the number of digits you pressed when originating a call in handset is more than 5, the set INSERT DGT is inserted before the number you pressed. However, the number you pressed should not be C.O. Line number, C.O. Line group number, LCR, network LCR, or number starting with the function code

ACTION

- Select the MMC number [846].
- Select a desired handset number.
Or select a desired handset number using the [▼Volume▲] button, and press [RIGHT] soft button to move the cursor.
- Enter a desired item number.
Or select a desired item using the [▼Volume▲] button, and press [RIGHT] soft button to move the cursor.

WLAN CONFIG

DESCRIPTION:

This MMC is used to select AP type and de-register handsets.

Parameter	Description
REGISTER VoWLAN	Sets whether to permit the new registration of handsets. If this parameter is disabled, the new handset registration can not be started.
WIP REGIST CLEAR	Clears the registration according to handset. The De-registration mode includes 'FORCED' and 'NORAML'. The FORCED mode is used to clear the system-related DB in order to register a new handset due to the damage of handset. The NORMAL mode is used to clear both the system DB and handset DB by exchanging messages between the system and handset.
STATIC WIP IP	Sets whether to use a static IP in handset. This value should be set in advance before registering handset.
SELECT AP TYPE	Selects the AP type to be used. Only one type of AP is simultaneously available in one system. When changing the AP type, restart the system (Mandatory option item). This value should be set first when setting WLAN.

ACTION

1. Select the MMC number [849].
2. Press the [SPK] key to move to the Select menu. To activate registration, enter passcode first. Default is 0000.
3. Select whether to enable or disable HANDSET registration.
4. Clear the registration of the handset.
5. Select whether to use a Static WIP IP.

ALARM REPORTING

DESCRIPTION:

This MMC is used to view, store, print or clear system alarms. There are two levels of faults displayed via alarm code, major alarms and minor alarms. Major alarms codes are usually service affecting and require a certified technician to determine the fault. A minor alarm indicates a fault that may or may not be service affecting and usually does not seriously degrade the systems operating capabilities. The alarm buffer will hold up to 100 alarms on a first in - first out (FIFO) basis. Alarms will provide a date and time stamp based on the system time. If applicable the hardware cabinet, port, and/or slot will be displayed.

ALARM REPORTING OPTIONS (Select one of the options)

0	VIEW ALARM	View alarm buffer
1	OVERFLOW CONTROL	OVERWRITTEN – When buffer is full, the oldest entry in buffer overwritten. STOP RECORDING – When buffer is full, stop recording alarms.
3	CLEAR ALARM BUF	Clears alarm buffer.
4	PRINT ALARM BUF	Prints contents of alarm buffer to the assigned alarm IO port.

ALARM CODE LOCATION DEFINITION (See Alarm Code Table)

C: Cabinet number
S: Slot number
P: Port number

Note: Cabinet, slot and port do not apply to all alarm codes

MMC: 851

PROGRAM KEYS

UP & DOWN	Used to scroll through system alarms.
KEYPAD	Used to enter selections
SOFT KEYS	Enter/leave option
SPEAKER	Used to store data and move to next MMC
TRANSFER	Enter/exit MMC

ACTION

1. Press TRANSFER 851.
Display shows.
2. Enter desired option or press the up and down keys and press the RIGHT soft key to select the desired option.
3. System displays the alarm count number, date and time stamp (uses station, configuration for display format, date, time will be 24 hour format). Alarm type and cause code will display.
4. Press UP or DOWN arrows to scroll through other alarms.
5. To return to Alarm Options, press left soft key and choose new option
OR
Press TRANSFER to exit
OR
Press SPEAKER to advance to next MMC.

RELATED ITEMS: [MMC 852 ALARM KEY ASSIGNMENTS](#)

MMC: 852 SYSTEM ALARM ASSIGNMENTS

DESCRIPTION:

This MMC allows the assignment of system alarms to ring and display the alarms on stations that have the Alarm Key assigned. The System Alarm Key is programmed in Station Key Assignments (MMC 722). System Alarm key programming is tenant wide (tenant 1 and 2). Alarms not programmed to report to the System Alarm key will still be retained in the maintenance alarm buffer for Alarm Reporting (MMC 851). The alarm buffer will hold up to 100 alarms on a First In - First Out (FIFO) basis. Pressing the System Alarm key will silence the audible alarm until another alarm is generated by the system. The specific fault alarm data can be displayed via MMC 851 System Alarm Reporting.

NOTE: Alarm Notification Off/On (0/1) determines if the alarm provides a visual and audible notification to the System Alarm key station(s).
Pressing the System Alarm key and the release key will silence the audible alarm only at the station that pressed the System Alarm key and the release key. See alarm displays table for assignments.

PROGRAM KEYS

UP & DOWN	Used to scroll through system alarms.
KEYPAD	Used to enter selections
SOFT KEYS	Enter/leave option
SPEAKER	Used to store data and move to next MMC
TRANSFER	Enter/exit MMC

ACTION

1. Press TRANSFER 852.
Display shows.
2. Enter desired Alarm Display number (eg. 16)
OR
Press the up and down keys to select desired option and press the right soft key and to advance the cursor.
3. To select if the alarm is active press 1 for YES and 0 for NO. An entry will advance the cursor to return to step 2.

ALARM CODE DEFINITIONS

ALM NO.	ALM CODE	ALARM	DEFINITION
01	MJA01	POR Restart	MP restart process has been executed via power on restart (POR).
02	MJA02	Button Restart	MP restart process has been executed via button reset or MMC 811.
03	MJA03	Mem Reset	The system RAM has been cleared via manual programming Web Management resulting in a system reset.
04	MJA04	Watchdog Reset	The MP has reset (Watchdog Reset)
05	MJA05	LCP Reset	An LCP has reset
06	MJA06	PCM Switching	A fault has occurred in the Switching Control.
	MJA10	S/W Exception Err	Other kinds of System Restarts
08	MJB01	HDLC Com Error	Communications to Expansion Control Processor lost or faulty.
09	MJB02	Memory Alarm 1	A RAM diagnostic check error has occurred in the MP.
10	MJB03	Memory Alarm 2	
11	MJB04	Memory Alarm 3	
12	MJB05	Memory Alarm 4	
13	MJB06	IPC MSGQ Over	The IPC message queue is over 80% full
14	MJB07	Task MSGQ Over	The IPC message queue is now back under 80% full
15	MJC01	DTMF Fault	<i>An abnormal interrupt has occurred in the system DTMF resources.</i>

MMC: 852

ALM NO.	ALM CODE	ALARM	DEFINITION
16	MJC02	Tone Fault	<i>An abnormal interrupt has occurred in the system tone resources. IE busy, ringback, error, no more calls etc.</i>
17-23	NOT USED		
24	MJC10	AA-DTMF Fault	An abnormal fault reported in one of the systems AA card DTMF resources.
25	MJC11	AA-DTMF Rec	An abnormal fault reported in one of the systems AA card DTMF resources has recovered.
26	MJC12	E911 Restart	An E911 card has rebooted
27	MJC13	E911 Block	An E911 card could not be accessed
28-29	NOT USED		
30	MJC16	WLI Restart	The WLI card has restarted
31	MJC17	WLI Block	The WLI card could not be accessed
32	MJD01	Sync Failure	Clocking on PRI cards has become asynchronous.
33	MJD02	Sync Recovery	Clocking on PRI cards has become synchronous.
34	MJD03	Red Alarm	Locally detected loss of PCM carrier on PRI card for more than 250 ms. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
35	MJD04	Red Alarm Rec	PCM carrier detected locally on PRI cards. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
36	MJD05	Yellow Alarm	Remotely detected failure transmitted in frame on PRI card. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
37	MJD06	Yellow Alarm Rec	Remotely detected failure restored transmitted on PRI card. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
38	MJD07	Blue Alarm	All one's being transmitted on facility on PRI card. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
39	MJD08	Blue Alarm Rec	A blue alarm condition has been cleared. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>

MMC: 852

ALM NO.	ALM CODE	ALARM	DEFINITION
40	MJD09	Bit Error Alarm	Alarm is activated when the when error rate exceeds 1×10^{-6} errors. Note: 1×10^{-6} is threshold for minor alarm, 1×10^{-3} is threshold for major alarm errors on PRI or BRI.. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
41	MJD10	NTWRK Event	An Implausible event has occurred on the PRI or BRI Network digital line. Protocols do not match or subscriber ID mismatch. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
42	MJD11	SPID Init Err	The BRI received an error from the network <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), Channel(1 through 16)</i>
43	MJD12	SPID Init Rec	The BRI has recovered from an error on the network <i>Alarm Data = Cabinet, Slot Channel C1,2 (S1 through 10), C (1 through 16)</i>
44	MJD13	LPBK Error	Internal on demand loopback failed. <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), (C1 through 24)</i>
45	MJD14	LPBK Recovery	Internal on demand loopback test passed. <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), (C1 through 24)</i>
46	MJD15	BRI DL Unavail	A BRI data link is out of service. <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), (C1 through 16)</i>
47	MJD16	BRI DL Recovered	A BRI data link is back in service. <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), (C1 through 16)</i>
48	MJD17	RAM Error	An error has occurred in the T1/PRI or BRI card RAM. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
49	MJD18	T1 Restart	The T1 card has restarted <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>

MMC: 852

ALM NO.	ALM CODE	ALARM	DEFINITION
50	MJD19	PRI Restart	The PRI card has restarted <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
51	MJD20	BRI Restart	The BRI card has restarted <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
52	MJD21	PCM Loss	Loss of PCM coding on a digital facility. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
53	MJD22	PCM Recovery	Recovery of PCM coding on a digital facility. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
54	MJE01	MGI Restart	An MGI card has restarted.
55	MJE02	MGI Stop	An MGI card has stopped.
56	MJE03	MGI IP Duplicate	MGI IP address conflict.
57	MJE04	MGI Ntwk Error	
58	MJE05	MGI Ntwk Rec.	MGI Recovery.
59	MJE06	MGI DSP Error	
60	MJE07	MGI DSP Run	
	MJE10	SVM Card Restart	Card Restarted
	MJE11	SVM Card Halt	Card Halted
	MJE12	SVM Card Down	Card When Down
	MNF32	SVM Card Ready	Alarm Code when voicemail is ready.
61	MNF01	Card Out	Alarm Code when voicemail request the number to MCP after restarting. A circuit card mounted in a universal slot has been removed from service or is not recognized by the Common Control Processor <i>Alarm Data = Cabinet-Slot (C1,2)-(S 1 through 10)</i>
62	MNF02	Card In	A circuit card mounted in a universal slot has been returned to service. <i>Alarm Data = Cabinet-Slot (C1,2)-(S 1 through 10)</i>
63	MNF03	IPC Error	Inter processor communication error has occurred. <i>Alarm Data = Cabinet-Slot (C1,2)-(S 1 through 10)</i>

MMC: 852

ALM NO.	ALM CODE	ALARM	DEFINITION
64	MNF04	Trunk Fault	Out of service trunk detected via loop detect. Internal CODEC test. <i>Alarm Data = Cabinet-Slot Port (C1,2)-(S1 through 10), (P1 through 16)</i>
65	MNF05	Trunk Recovery	Out of service trunk detected via loop detected as out of service is now operational. <i>Alarm Data = Cabinet-Slot Port (C1,2)-(S1 through 10), (P1 through 16)</i>
66	MNF06	Trunk Disconnect	Out of service trunk detected via seizure of trunk. External seizure test. <i>Alarm Data = Cabinet, Slot Port (C1,2)-(S1 through 10), (P1 through 16)</i>
67	MNF07	Trunk Connect	Out of service trunk recovered via seizure of trunk External seizure test. <i>Alarm Data = Cabinet, Slot Port (C1,2)-(S1 through 10), (P1 through 16)</i>
68	MNF08	SIO TXQ Over	SMDR buffer above 80% capacity.
69	MNF09	SIO TXQ Under	SMDR buffer below 80% capacity.
70	MNF10	T1 Out of Service	A digital line is out of service
71	MNF11	T1 In Service	Digital line has been restored to normal service. <i>Alarm Data = Cabinet,Slot (C1-2,S1 through 10)</i>
72	MNF12	SIO Out	IO port has lost DTR <i>Alarm Data = SIO 1 through 6</i>
73	MNF13	SIO In	IO port has regained DTR. <i>Alarm Data = SIO 1 through 6</i>
74	MNF14	TODC Error	Time of Day Clock in the MCP has erred.
75	MNF15	TSW Over Alarm	TSW has been requested to exceed the capacity of available time slots. Maximum 192 per cabinet. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
76	MNF 16	PSU Alarm	Indicates there are over 96 ports in a cabinet with a single DPCU and more power is required. (DLI,SLI ports) <i>Alarm Data = Cabinet (1,2)</i>
77	MNF 17	PSU Alarm Rec	A second DPCU has been recognized when added after alarm condition of <i>Alarm Data = Cabinet (1,2)</i>
78	MNF 18	SLI Fault	An SLI card has been detected as out of service via an internal CODEC test. <i>Alarm Data = Cabinet, Slot Port (C1,2) (S1 through 10) (P1 through 24)</i>

MMC: 852

ALM NO.	ALM CODE	ALARM	DEFINITION
79	MNF 19	SLI Recovery	An SLI card detected as out of service has been detected as recovered and is in service via internal CODEC test. <i>Alarm Data = Cabinet, Slot Port (C1,2) (S1 through 10) (P1 through 24)</i>
80	MNF 20	PSU B Alarm	A second PSUB is required
81	MNF 21	DSS Alarm	The number of DSS units has been exceeded
82	MNF 26	SIO RxQ Over	The SIO receive buffer is over 80% full
83	MNF 27	SIO RxQ Under	The SIO receive buffer is back under 80% full
84	MNF 28	LAN Printer Err	A LAN printer has lost communication
85	MNF 29	LAN Printer Rec	A LAN printer has recovered communication
86	MNG 01	Phone Disconnect	
87	MNG 02	Phone Connect	
88	MNG 03	OFF Hook Alarm	
89	MNG 04	On Hook	
90	MNG 05	MGI Packet Loss	
91	MNG 06	MGI Packet Delay	

MMC: 853

MAINTENANCE BUSY

DESCRIPTION:

This MMC is used to place stations, trunks, and common resources equipment in a maintenance busy condition. This can be used to isolate suspected intermittent problem equipment. Stations placed in maintenance busy will behave like a station in DND when called. The calling stations display (if equipped) will show "MADE BUSY" when called. Stations receiving DID type calls will receive a DND/ No more calls tone. The station display will still function with station and date. When the busy station is accessed, it will function like a locked out station. Trunks made busy can not originate calls. Ring down type trunks will still ring the programmed destination.

MAINTENANCE BUSY OPTIONS

- 0. TRK = Trunks
- 1. STN = Stations
- 2. PAGE = Page Ports
- 4. DTMFR:DSP = DSP # 1-8
- 5. CID:DSP = CID DSP # 1-8
- 6. CONF:GRP = CONF:GRP #1-6
- 7. MGI = MGI # 0-8

NOTE: Selectable conditions 0 = idle state
1 = busy state

DIAGNOSTIC TIME

DESCRIPTION:

Provides a means to set the OfficeServ 7100 Diagnostic Time. The OfficeServ 7100 diagnostics tests include memory audits, internal loopback tests on digital trunks, DSP, CID DSP. Additional tests include CODEC tests on analog trunk and station cards and tone tests. If the diagnostics cannot complete the tests because of system traffic, the system will abort the test and retry during the next programmed diagnostic time. It is recommended to assign the diagnostic time during non-peak traffic periods.

MMC: 856 TECH PROGRAMMING LOGS

DESCRIPTION:

This MMC lists the date, time and entry location of the last 8 times that technician programming was accessed. This will allow a technician to determine if there was unauthorised access to system programming and where this access occurred. The information stored in this log will consist of 2 elements, the date and time it occurred at and the access location.

There are 4 types of access location information as described below:

NNNN This would be the extension number of a keyset that had accessed programming directly.

LAN This would indicate that programming was accessed by OfficeServ™ Web Management via the LAN connection.

VIRTUAL CABINETS

DESCRIPTION:

Any device or resource on the OS7100 that does not have a physical port connection will now be found in the Virtual Cabinet. Items found in the virtual cabinets are logical devices such as virtual extensions, logical resources such as VoIP trunks and SPnet trunks, or logical connections that connect to IP phones.

- Cabinets 2 thru 5 are “Virtual Cabinets”
- Each Virtual Cabinet has 3 slots with 8 logical ports per slot. The slots are numbered 2~ 5.

Use this MMC to modify and configure Virtual cabinets.

MMC 857 configuration directly affects the appearance in the numbering plan (MMC 724) for these devices.

The virtual assignments with the default settings highlighted are shown below:

Virtual Cab	Slot 1	Slot 2	Slot 3
5	BRI STN	SPNET TRK	SPNET TRK
	GCONF STN	SIP TRK	SIP TRK
	SPNET TRK	H323 TRK	H323 TRK
	SIP TRK		
	H323 TRK

MMC: 861

SYSTEM OPTION

DESCRIPTION:

Assigns several options (listed below) on a system wide basis.

OPTIONS

- | | | |
|---|-------------------|---|
| 0 | AUTO UPDATE TIME | When this option is set to ENABLE The system will synchronize the system time and date setting to the data received on an ISDN call connect message. If a system has multiple PRI cards the PRIORITY 1 setting in MMC 826 will determine the card used. |
| 1 | SYSTEM SPEED BIN | When this option is set to 500. The system will have a maximum of 500 system speed dial bins numbered 500 to 999. When set to 950 the system will have a maximum of 950 system speed dial bins numbered 050 to 999. Station speed dial bins will be 000 to 049.

Note: Personal speed dial number changes from 2 digits to 3 digits when 950 is selected. |
| 2 | IDLE WHEN ENBLOCK | When this option is enabled the ITP-5121D keyset will receive incoming calls when dialing out before the SEND button is pressed. When disabled an incoming call will appear as a call waiting call if idle CALL key is available.

Note: This option has no effect if #3 below is disabled. |
| 3 | 2 LINE ENBLOCK | When this option is enabled the ITP-5121D keyset can dial a telephone then press the SEND button to place the call. This operates like a cell phone. When disabled the ITP-5121D sends each digit as you dial it. |
| | LP TRK TONE DISC | NOT USED IN USA |
| | SPNET OVERLAP | NOT USED IN USA |

MMC: 861

SPNET CLI TABLE	In the case of IP networking calls to another node, this setting will determine which CLI table in MMC 321) to use to send CLI information across to the other network node(s).
E-LCR CLI TABLE	NOT USED IN USA
EXTERNAL BGM/MOH	The option allows the user to choose to provide BGM/MOH from an external music source or to use the internal chime. When set to EXT, SOURCE, the external music source provides the music for internal and CO held calls, and station background music. When set to INT. CHIME, the embedded chime source (on MP10) will provide the sound for internal and CO held calls. The internal chime is not played for station background music.
4 LP TRK TONE DISC	When this is set to ON loop trunk can be disconnected by detecting busy tone.

PROGRAM KEYS

UP & DOWN	Used to scroll through options

PART 3. VOICEMAIL AND AUTOMATED ATTENDANT PROGRAMMING ARCHITECTURE

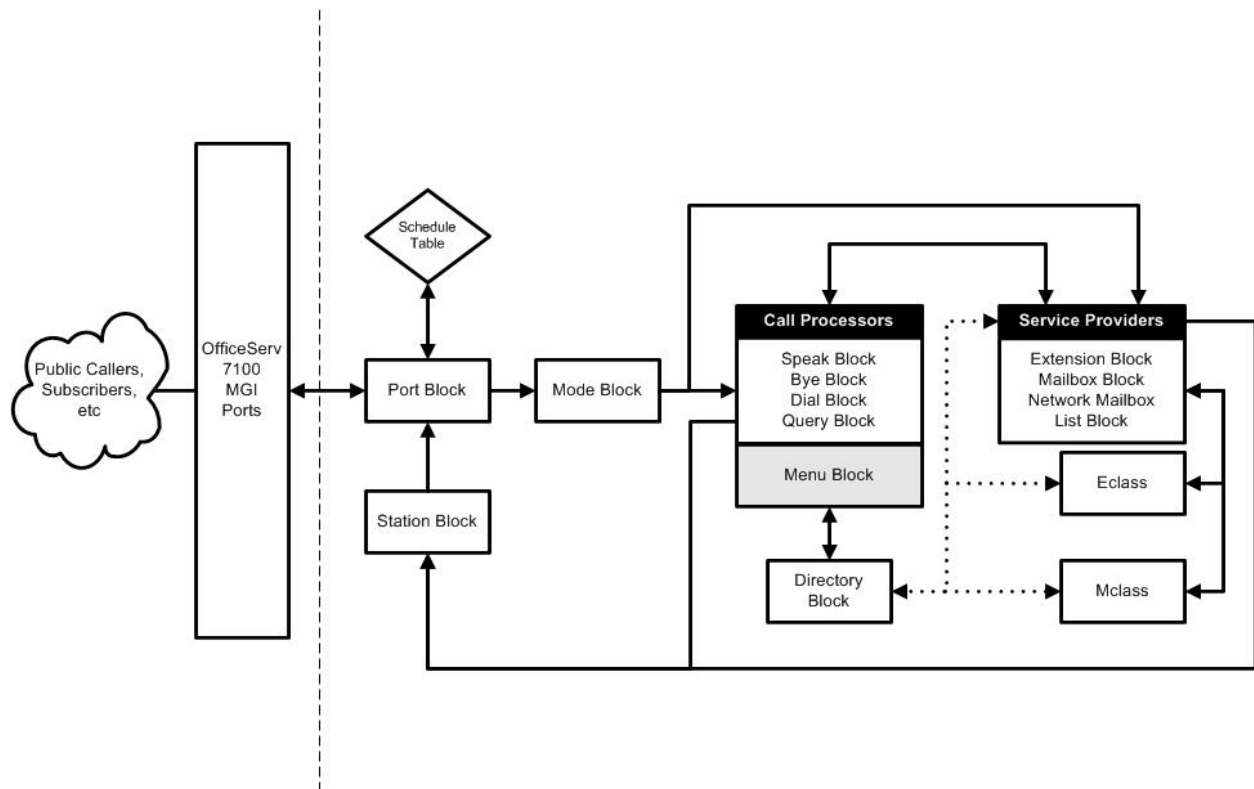

3.1 OVERVIEW

The OfficeServ 7100 voicemail and automated attendant application, much like the in-skin Samsung voicemail product (SVMi), is radically different than most other voicemail systems. This is due to the high level of flexibility and control the technician is given for setting up applications. As such a technician who is unfamiliar with the Samsung voicemail products may find some of the terminology and thought processes to be totally foreign. The purpose of this section of the manual is to simplify the learning process and equip the technician with the tools necessary to set up and maintain the system.

The major difference with the Samsung solution is that the voicemail and automated attendant functions are simply components of a larger call processing server. As such the two are very tightly integrated, often blurring the distinction between them. The programming section of this manual delineates which functions are primarily automated attendant related and which are voicemail related, but it is important to remember that there is no hard line separating the two.

Programming in the system is based off of programming objects called blocks. In all there are 15 types of blocks, each with a very specific purpose. For example, a Mailbox block's purpose is to store a message and initiate message notifications. Blocks can also be "tied" together, allowing a blending of functionality. For example a Menu block can pass a caller to a Directory block allowing a user to search for a subscriber. The following diagram shows the basic control architecture of the system and how the various blocks interact. Blocks are discussed in depth later in the manual.

OfficeServ 7100 Call Processor Architecture

Extension and Mailbox blocks are another major departure from typical voicemail systems. The Samsung solution treats the subscriber's phone and voicemail box as two separate objects. The Extension block is used to control the subscriber's call processing, and is responsible for answering the caller, providing single digit options, and call rerouting functions. The Mailbox block is responsible for recording and storing messages, and for initiating message delivery. In a typical call flow a caller will ring the subscriber's phone, forward to the voicemail system, be answered by the Extension block, and then be forwarded to the Mailbox block to leave a message. The Mailbox block then lights the subscriber's message waiting lamp and updates the display to show a new message.

Because of the tight integration with the voicemail the automated attendant gains some very useful features. It has access to all subscribers so it can easily provide directories, single digit dialing, group message distribution, and question and answer sessions. Since the automated attendant and voicemail systems are really one application all of these features can be programmed seamlessly and run much faster than traditional systems where the voicemail and automated attendant are separate entities.

The system supports up to 100 voicemail subscribers, meaning that the total number of mailbox, list, and network mailbox combined is capped at 100. The MMC+ card will allow storage of up to 62 hours of voicemail message storage space.

PART 4. AUTOMATED ATTENDANT PROGRAMMING OVERVIEW

4.1 PROGRAMMING OVERVIEW

The OfficeServ 7100 Automated Attendant program arrives from the factory loaded with many common applications pre-programmed. This includes the creation of several default menus to greet callers and allow them to dial an operator, a known extension number, or access a company directory. The only thing left for the technician to do is record system prompts and set up customized applications. This is called programming the Automated Attendant.

The Automated Attendant is embedded into the system Main Processor, or MP. Although it is tightly integrated to the phone system it is a separate application, and as such is programmed through a separate interface. Note that some Automated Attendant applications may require that Man Machine Code (MMC) programming changes be made in the phone system.

The Automated Attendant programming interface is a web based tool that is specifically coded to use the Internet Explorer 6.x web browser. As a security measure, the web application is user account based, meaning that users must log in with a username and password in order to access programming.

Programming can be accessed by opening the Internet Explorer 6.x browser and entering the following address: <https://165.213.176.100>

Note that the web server does require a secure connection and as such the address begins with https, not http. For port forwarding scenarios this is important because HTTP connections are formed on port 80, but secure HTTP connections are formed on port 443.

Also note that the IP address specified will depend on the IP address given to the main processor (MP) card in MMC 830.

Due to the highly integrated nature of the Automated Attendant and Voicemail applications the web application is used to program both seamlessly as one application, similar to the in-skin Samsung voicemail (SVMi) cards used in other OfficeServ systems.

In addition to the web programming tool, the system also includes a Telephone User Interface (TUI) that can be accessed via any DTMF capable telephone. The TUI interface is used to record or edit spoken system prompts or change the current Operating Mode.

4.2 PROGRAMMING LEVELS

In order to log in to the web programming interface, users must enter a login ID and password. These user accounts are created by the Site Administrator and are used to manage access to the application. There are four levels of administration: Site Administrator (0), System Administrator (1), Application Administrator (2), and Subscriber Administrator (3).

4.2.1 Site Administrator

This is the main administrator level for the system. Only the default OfficeServ 7100 account, "admin", may have this user level. It can be neither assigned to any other account, nor can it be revoked from the "admin" account. The Site Administrator has full access to every feature and function in the web programming interface.

4.2.2 System Administrator

This is the highest level of administration that can be assigned to a user account. A System Administrator has full access to all Automated Attendant programming. The sole difference between this level and the Site Administrator is that a System Administrator cannot create or modify user accounts.

4.2.3 Application Administrator

This level of administration is assigned to users who have a good understanding of Automated Attendant programming practices. It has access to almost all features in the Automated Attendant. The only screen an Application Administrator cannot access is the System Parameters screen.

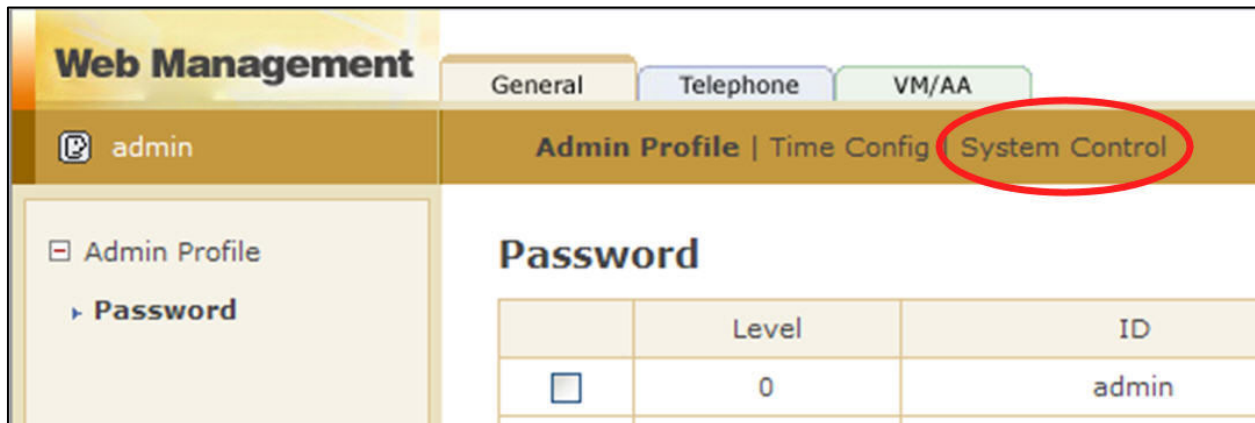

4.2.4 Subscriber Administrator

The Subscriber Administrator level deals primarily with the Voicemail and has no access to Automated Attendant programming.

4.3 DATABASE MANAGEMENT

The programming data for the Automated Attendant is stored locally on the 256 MB MMC+ card located in the main processor (MP) Media Card slot. This card stores the application itself, as well as the web interface, operating system, and customized database.

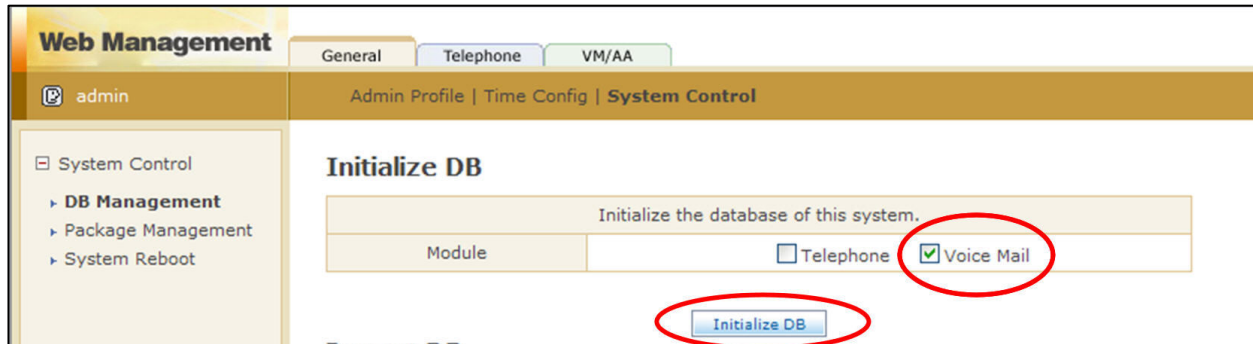

The web interface includes a facility that allows a Site, System, or Application administrator to backup or restore data. During the backup process a compressed archive (.TGZ) file will be generated that can be downloaded to the administrator's PC.

4.4 DEFAULTING THE AUTOMATED ATTENDANT

The Automated Attendant cannot be defaulted by turning off the main processor (MP) card's memory switch. The only way to default the Automated Attendant is through the web interface, and it can only be done through the Site Administrator account.

To default the Automated Attendant log in to the Site Administrator account. This will load the web interface to the General tab. Click the menu item called System Control.

Check the box that says "Voice Mail" and then click "Initialize DB". Click "OK" to confirm.

Note that the system will be rebooted when "OK" is clicked. Also note that due to the level of integration between the Voicemail and the Automated Attendant initializing the Automated Attendant will also default the Voicemail, and visa versa.

PART 5. AUTOMATED ATTENDANT PROGRAMMING PROCEDURES

5.1 ACCESSING TUI PROGRAMMING

To access the telephone user administration programming interface the technician must call in to the main system greeting. This will typically be the Day Main Menu. If the "enter your password" prompt is played when dialing the automated attendant, escape to the main menu by pressing "*"

While listening to the menu prompting, press "#" followed by 3 zeros. Note that if the "Maximum Caller Entry Digits" field of the [MENU BLOCK](#) has been changed, the number of zeros entered must correspond. For example, if "Maximum Caller Entry Digits" is set to 6, it will require that "#" and 6 zeros be entered.

This will request access to the administration interface. When successful, an "enter your password" prompt will be played. This password is the "System Admin" password set on the [SYSTEM PARAMETERS](#) screen. The default is "0000". Once administration has been accessed, the system will play all of the available options.

To record or edit system prompts press 1 and follow the spoken instructions.

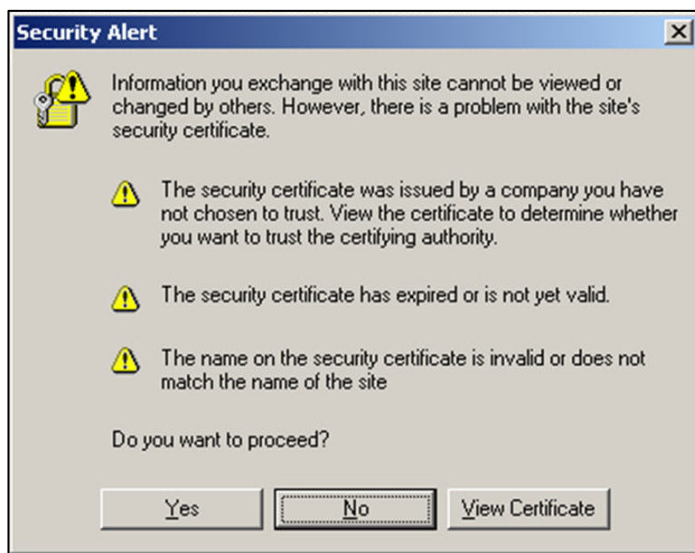

To change the current Operating Mode press 3 and follow the spoken instructions. Any available [MODE BLOCK](#) may be selected. This will override the [SCHEDULE TABLE](#) entirely until reset.

5.2 ACCESSING WEB PROGRAMMING

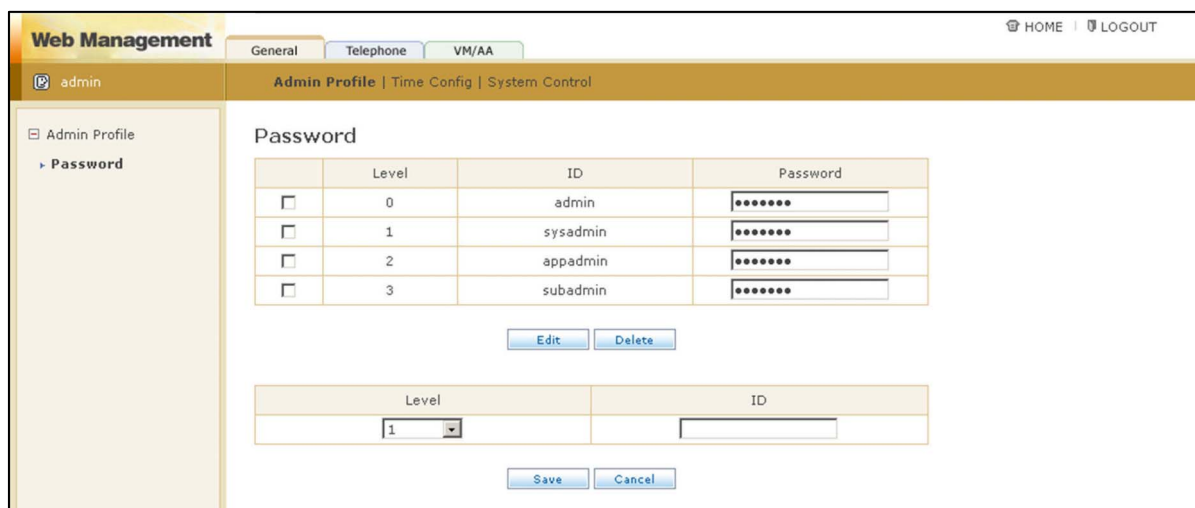

To access Automated Attendant programming, open Internet Explorer 6.x and in the address bar enter the prefix "https://" followed by the IP address assigned to the OfficeServ 7100 main processor (MP) in MMC 830. This will only work if the PC running Internet Explorer 6.x is on the same LAN as the OfficeServ 7100.

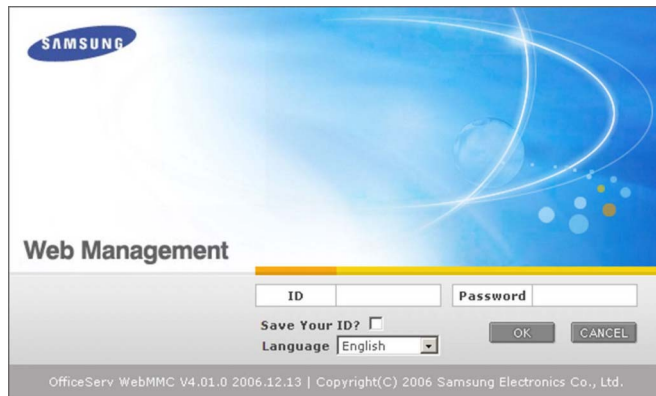

Because the connection is secure a warning will be displayed stating that there is no valid certificate.

This warning is displayed because the site certificate is not present. Simply click Yes to bypass the screen and load the login page.

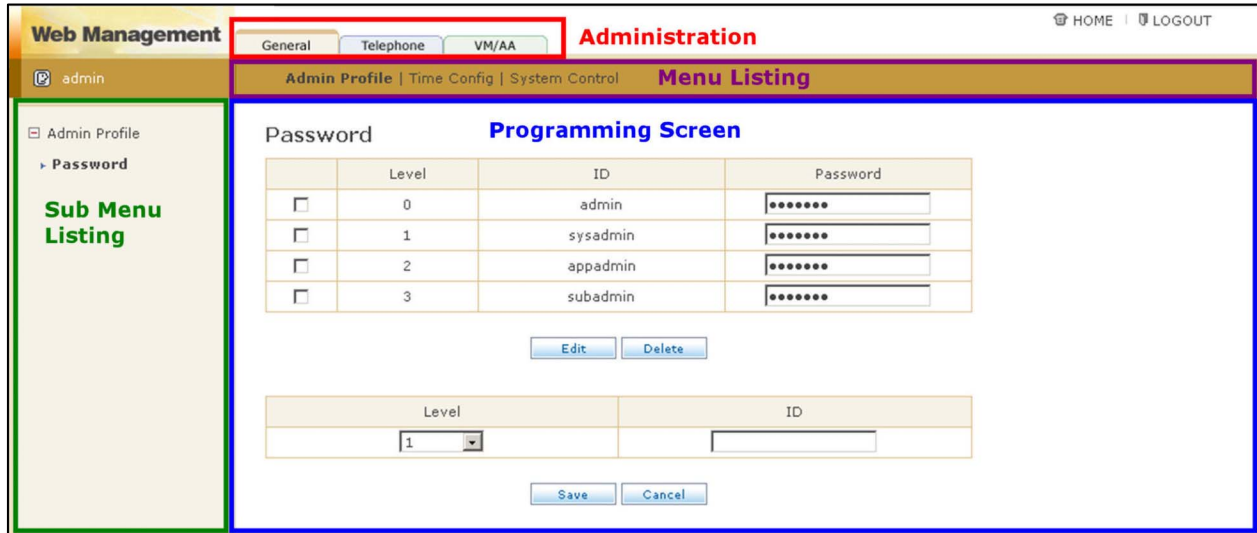

Access to the web interface is controlled by user accounts. The default user account is the Site Administrator. The username for this account is "admin" and the password is "samsung".

After logging in with the Site Administrator account it is possible to change this password. Alternate user accounts can also be created. To create a new user account choose an administration level (1 through 3, explained in Part 3.2 of this manual) and set a username (ID). The default password for new accounts is "samsung". To change a password for any account check the box to the left of that username, modify the Password field, and then click Edit.

The web interface is broken down into several pieces as shown below:

5.2.1 Administration Section

This area is used to switch between the various programming interface tabs. General is accessible only for the Site Administrator account and is used to manage administration accounts as well as system database management. VM/AA is used to program the Voicemail and Automated Attendant programs.

NOTE: The Telephone tab is NOT for use in the USA and is known to cause data corruption!

5.2.2 Menu Listing

This area displays the menu options for the selected programming interface.

5.2.3 Sub Menu Listing

This area lists all screens available for the selected menu option.

5.2.4 Programming Screen

The programming screen contains the actual data for the selected menu option or submenu selection.

5.3 PROGRAMMING SCREEN ELEMENTS

Though each programming screen is unique, there are certain common interface elements to be aware of.

5.3.1 Page Navigation Buttons

The page navigation buttons are used in the event that there is too much data to fit into one screen. The numeric list in the center defines the group of pages that is currently being viewed. Simply click one of the numbers to navigate to that page. The First button will jump directly to the first group of pages, namely page 1 through page 5. The Previous button will jump to the group of pages immediately preceding the current group. The Next button will jump to the group of pages immediately succeeding the current group. The Last button will jump directly to the last group of pages.

5.3.2 Block Search

The block search feature is used to quickly find a specific block by name or number when there are many pages of blocks available. The Menu block, for example, may have many pages. The block search allows a user to search for a specific Menu without having to manually look through all of those pages. Simply enter the name of the block and click Search. Certain types of blocks, such as Extension and Mailbox blocks, can also be searched by number instead.

5.3.3 Block List

<input type="checkbox"/>	No.	Label Name
<input type="checkbox"/>	1	Day Main
<input type="checkbox"/>	2	Direct Station
<input type="checkbox"/>	3	Direct Trunk
<input type="checkbox"/>	4	Forward Station
<input type="checkbox"/>	5	Forward Trunk
<input type="checkbox"/>	6	Holiday Main
<input type="checkbox"/>	7	Night Main
<input type="checkbox"/>	8	Record Call
	9	TEMPLATE MNU
<input type="checkbox"/>	10	Transfer to MBX

The block list is used to display all available blocks and also allow users to edit or remove blocks. To edit a block, simply click the Label Name. The checkboxes on the left are used for deleting one or more blocks.

5.3.4 Block Creation and Removal

The block creation and removal buttons are used to create new blocks or delete existing blocks. To delete a block or blocks check the box next to the appropriate blocks and then click Delete. To create a new block simply click Add.

5.3.5 Block Navigation

Sometimes it may be necessary to edit many of the same block type. For instance, after adding a new Mode block it may be necessary to update all Menu blocks to reflect some new setting. The block navigation buttons exist to eliminate the need for a user to constantly reload the block listing to move to another block. Instead the user can use the block navigation keys to directly load the previous block in the block list by clicking Prev, or to move to the next block on the block list by clicking Next.

5.3.6 Block Editing

The block editing buttons are used to perform a variety of actions. The Close button will cancel any changes and exit to the block list. Reload will refresh the current page. Save & Exit will save any changes to the page and exit to the block list. Save will save changes to the block and remain viewing the current page. Copy allows the user to copy the current block to a new block of a different name. Refer will display a list of all other blocks in the system that have pointers set to reference the current block. For example, every Menu block has a pointer that goes to the Bye block. So by selecting Refer in the Bye block, a list of all Menu blocks would be displayed.

Status Screen

DESCRIPTION:

The Status Screen is the default screen that is loaded when logging into the automated attendant. It is a read-only screen, displaying various real time statistics about the system.

MAIN SCREEN:

Status Screen

Port	Mode	Active Block	Status
1	Day	Day	Idle
2	Day	Day	Idle
3	Day	Day	Idle
4	Day	Day	Idle

Reporting	11/04/06~11/23/06 5:30PM		
Call To-Date	903	Number of Subscribers	84
Average Calls per Week	329	Total Message Count	0
Directory Accesses	0	Avg Messages/Mailbox	0.0

Operating Utilities

Display Error Log

DESCRIPTION:

The OfficeServ 7100 provides several logs that can be useful for both debugging and application development. The Display Error Log screen shows error and warning information for the voicemail and automated attendant systems. Events are logged in an easily readable form, displaying the error type and time and date information on one line and the actual error listing on the next. The Error Log can be downloaded by clicking the Down button.

DISPLAY ERROR LOG SCREEN:

Operating Utilities

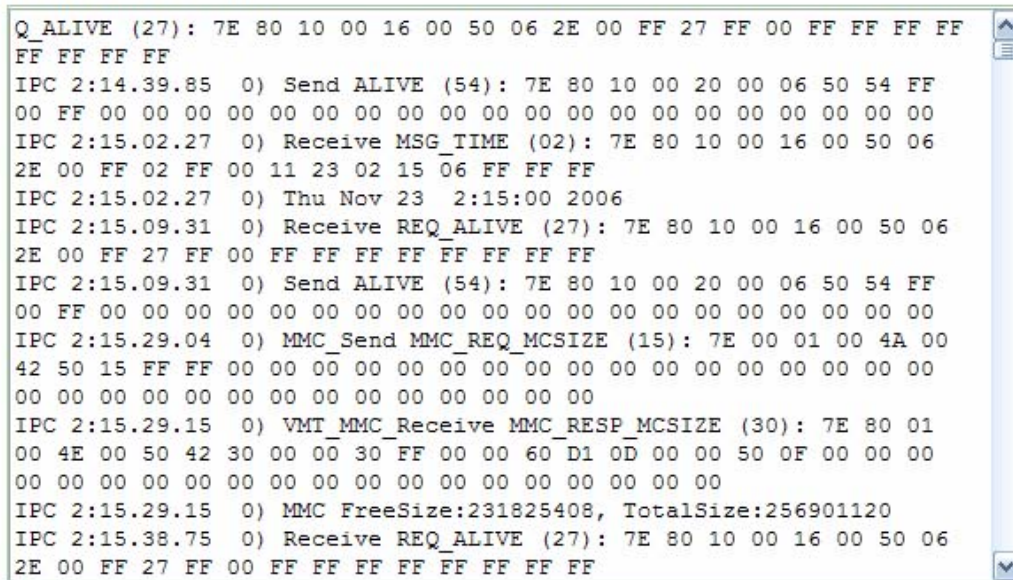

Activity Log

DESCRIPTION:

The OfficeServ 7100 provides several logs that can be useful for both debugging and application development. The Activity User Log screen shows all activity in the voicemail and automated attendant systems. Due to the extreme technical nature of the Activity Log records, this log is mainly aimed at advanced users. The Activity Log can be downloaded by clicking the Down button.

ACTIVITY USER LOG SCREEN:

Operating Utilities

Shutdown VM

DESCRIPTION:

The Shutdown VM screen, as the name implies, is used to exit the voicemail and automated attendant application. This is an important step when shutting down the OfficeServ 7100. Failure to exit the system properly can lead to lost or corrupted messages or programming. To prevent accidental exit, the administrator password must be entered in order to shut down the system.

SHUTDOWN VM SCREEN:

Input Password

Operating Utilities

DB Backup

DESCRIPTION:

The OfficeServ 7100 provides the ability to backup and restore voicemail and automated attendant programming via the DB Backup List screen. Users can choose to backup or restore mailboxes, prompts, programming data, or any combination of the three. Backups are stored to a standard .tar archive file.

DB BACKUP LIST SCREEN:

DB Backup List

		No	Data

The main Voice Studio screen is separated into 4 main sections:

The Language Selection box in the upper left used to determine which prompt language listings to display.

Next to that are the prompt Search Options. Prompts can be searched for by prompt number or description (script).

In the upper right corner is the Recording Device selection. This is the phone that will be used to record prompts. Enter the phone number and click Call to start the recording session.

Below these options is the Prompt List. The prompt list displays prompt number, description (script), and recording length. To edit a prompt from this region simply click the prompt number to open the recording screen.

PROMPT RECORDING STUDIO SCREEN:

Open Block Table

Dial

DESCRIPTION:

The OfficeServ 7100 automated attendant is programmed with a series of programming object called blocks. The Dial block is used to dial a number and then either release the call or branch to another programming block. The most common use for the Dial block is to transfer callers to an external destination, such as a cell phone or an 800 number. However, the Dial block can also be used in more advanced applications such as delayed paging or enabling DISA functionality.

SELECTION SCREEN:

Menu Block (Day Main)

General	Menu Input Processor	Activity
Label Name		Day Main
Input Processor Operating Parameters		
Take INPUT from	ENTRY	Store INPUT in
Digit Assignment		
Administration	#	Escape
Caller ENTRY Options and Other INPUT Parameters		
Prompt	1. 1001	Description
	2.	Description
	3.	Description
	4.	Description
	5.	Description
	6.	Description
Invalid condition prompt	0009	Description
Request password prompt	0011	Description
Maximum caller entry digits	4	
Wait for first entry digits	3	
Wait for subsequent digits	2	
Repeat prompt if NO ENTRY	1	
Retry if INVALID condition	2	
Key Value		
Append to KEY register	No	Store KEY Value in
<div style="display: flex; justify-content: space-between; align-items: center;"> Prev Next Refer Copy Save Save & Exit Reload Close </div>		

Field Name	Description
Label Name	The name of this Menu block
Take INPUT from	Determines what Menu routing will be based on
Store INPUT in	The input value can optionally be stored in a key for use in later menus. With this method the input value is not validated.
Administration	The digit to press to log in as a subscriber
Escape	The digit to press to return to the previous block

Field Name	Description
Prompt	Enter up to 6 prompts that will be spoken in sequence. These prompts will be played to the caller when the Menu first begins processing the call. They are typically used to speak company greetings and available menu options.
Invalid condition prompt	The prompt to play if the caller makes an invalid selection
Request password prompt	The prompt to play if the Administration digit is entered
Maximum caller entry digits	The number of digits to wait for from the caller. This field only applies if 'Take INPUT from' is set to ENTRY
Wait for first entry digits	The amount of time to wait for the first digit of the caller's selection to be entered
Wait for subsequent digits	The amount of time to wait between digits
Repeat prompt if NO ENTRY	The number of times to repeat the Menu prompts if no entry is made
Retry if INVALID condition	The number of retries allowed if the caller makes an invalid selection
Append to KEY register	If using the validated entry storage (below), this option decides whether to append or replace the existing key. Appending to the existing key is useful in scenarios where multiple Menu blocks are chained together.
Store KEY value in	The input value can optionally be stored in a key for use in later menus. With this method the input value is validated, meaning that it is only stored if a matching menu entry exists for the input value.

Open Block Table

Port

DESCRIPTION:

The OfficeServ 7100 automated attendant and voicemail are programmed with a series of programming object called blocks. The Port block represents a model of the physical automated attendant / voicemail port. It controls aspects such as system signaling and call setup settings. Most settings in the Port block have been defaulted for the OfficeServ 7100 to operate properly and should not be adjusted. Such fields are denoted with a description of (DO NOT ADJUST). Changing these fields will result in improper operation of the automated attendant and voicemail systems.

Field Name	Description
Label Name	The name of this Port block
Line is wink start	(DO NOT ADJUST)
Wait for loop current	(DO NOT ADJUST)
Rings before answer	(DO NOT ADJUST)
Hunt group type	This should match the ring type setting in MMC 601. If MMC 601 is set to Sequential, this setting should be 'Linear'. If MMC 601 is set to Distributed, this setting should be 'Rotating'
Disconnect signal	This setting is mainly provided to overcome issues with CO disconnect signaling. In some cases, the CO does not send the OfficeServ 7100 a proper disconnect signal, which can result in the subscriber getting messages with dial tone or error tone at the end. This field allows the system to look for a different type of disconnect signal, such as dial tone or fast busy.

Query

DESCRIPTION:

The OfficeServ 7100 automated attendant is programmed with a series of programming object called blocks. The Query block is a specialized block designed to take voice or DTMF input from the user and store it in a message that is then sent to a voicemail box. Multiple query blocks can be chained together to aggregate multiple questions into one message. This type of setup is commonly used for service call centers and survey centers.

Field Name	Description
Transfer	The string to dial to place a caller on hold and get dial tone
No answer	The string to dial to abort a call transfer when a no answer condition is detected
Connect	The string to dial to complete a transfer
Busy	The string to dial to abort a call transfer when a busy condition is detected
Rejected	The string to dial to abort a call transfer when the call is rejected
Error	The string to dial to abort a call transfer when and error is detected
Initiate	The string to dial to initiate a conference call
Set up	The string to dial to establish the conference once the second party has answered
Abort	The string to dial to abort the conference if the second party does not answer
Tear down	The string to dial to terminate the conference once it has been established

PART 6. VOICEMAIL PROGRAMMING OVERVIEW

6.1 PROGRAMMING OVERVIEW

The OfficeServ 7100 Voicemail program arrives from the factory loaded with many common features pre-programmed, and will dynamically create subscriber mailboxes upon initial boot-up of the system. The only thing left for the technician to do is add or delete mailboxes as necessary, set up any customized features, and instruct users how to record voicemail greetings. This is called programming the Voicemail. Further instructions for educating users on voicemail features can be found in the Samsung Voicemail User Guide.

The Voicemail is embedded into the system Main Processor, or MP. Although it is tightly integrated to the phone system it is a separate application, and as such is programmed through a separate interface. Note that some Voicemail features may require that Man Machine Code (MMC) programming changes be made in the phone system.

The Voicemail programming interface is a web based tool that is specifically coded to use the Internet Explorer 6.x web browser. As a security measure, the web application is user account based, meaning that users must log in with a username and password in order to access programming.

Programming can be accessed by opening the Internet Explorer 6.x browser and entering the following address: <https://165.213.176.100>

Note that the web server does require a secure connection and as such the address begins with https, not http. For port forwarding scenarios this is important because HTTP connections are formed on port 80, but secure HTTP connections are formed on port 443.

Also note that the IP address specified will depend on the IP address given to the main processor (MP) card in MMC 830.

Due to the highly integrated nature of the Automated Attendant and Voicemail applications the web application is used to program both seamlessly as one application, similar to the in-skin Samsung voicemail (SVMi) cards used in other OfficeServ systems.

In addition to the web programming tool, the system also includes a Telephone User Interface (TUI) that can be accessed via any DTMF capable telephone. The TUI interface is used to create, delete, or edit voicemail subscribers.

6.2 PROGRAMMING LEVELS

In order to log in to the web programming interface, users must enter a login ID and password. These user accounts are created by the Site Administrator and are used to manage access to the application. There are four levels of administration: Site Administrator (0), System Administrator (1), Application Administrator (2), and Subscriber Administrator (3).

6.2.1 Site Administrator

This is the main administrator level for the system. Only the default OfficeServ 7100 account, "admin", may have this user level. It can be neither assigned to any other account, nor can it be revoked from the "admin" account. The Site Administrator has full access to every feature and function in the web programming interface.

6.2.2 System Administrator

This is the highest level of administration that can be assigned to a user account. A System Administrator has full access to all Automated Attendant programming. The sole difference between this level and the Site Administrator is that a System Administrator cannot create or modify user accounts.

6.2.3 Application Administrator

This level of administration is assigned to users who have a good understanding of Voicemail programming practices. It has access to almost all features in the Voicemail. The only screen an Application Administrator cannot access is the System Parameters screen.

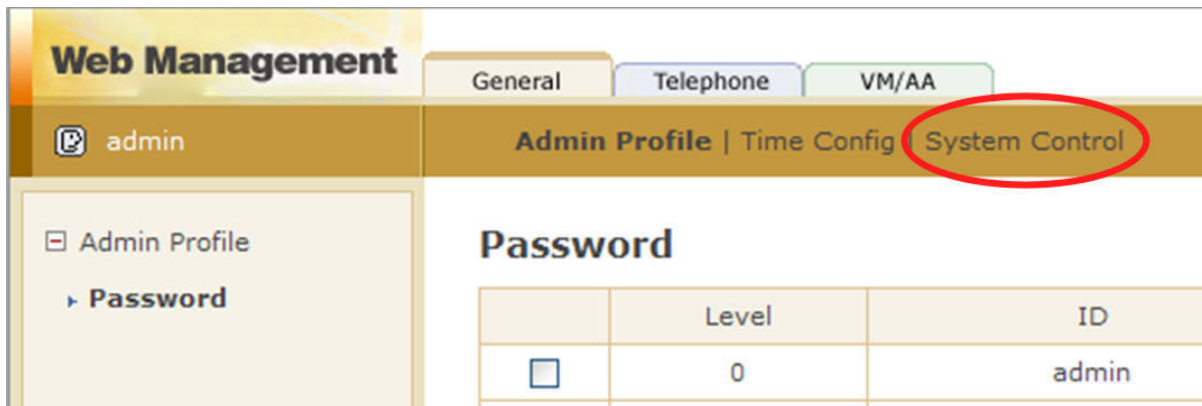

6.2.4 Subscriber Administrator

This is the lowest level of administration, and is typically assigned to staff such as personnel managers who are responsible for setting up or removing subscriber privileges. A Subscriber Administrator is only allowed to view system reports and add or delete voicemail subscribers.

6.3 DATABASE MANAGEMENT

The programming data for the Voicemail is stored locally on the 256 MB MMC+ card located in the main processor (MP) Media Card slot. This card stores the application itself, as well as the web interface, operating system, and customized database.

The web interface includes a facility that allows a Site, System, or Application administrator to backup or restore data. During the backup process a compressed archive (.TGZ) file will be generated that can be downloaded to the administrator's PC.

The screenshot shows the 'Web Management' interface. At the top, there are three tabs: 'General', 'Telephone', and 'VM/AA'. Below these, there is a navigation bar with 'Admin Profile | Time Config | System Control'. The 'System Control' tab is highlighted with a red circle. On the left side, there is a sidebar with 'Admin Profile' and 'Password' (indicated by a right-pointing arrow). The main content area is titled 'Password' and contains a table with the following data:

	Level	ID
<input type="checkbox"/>	0	admin

Note that Voicemail messages cannot be backed up, only subscriber and programming data.

6.4 DEFAULTING THE VOICEMAIL

The Voicemail cannot be defaulted by turning off the main processor (MP) card's memory switch. The only way to default the Voicemail is through the web interface, and it can only be done through the Site Administrator account.

To default the Voicemail log in to the Site Administrator account. This will load the web interface to the General tab. Click the menu item called System Control.

Check the box that says "Voice Mail" and then click "Initialize DB". Click "OK" to confirm.

Note that the system will be rebooted when "OK" is clicked. Also note that due to the level of integration between the Voicemail and the Automated Attendant initializing the Automated Attendant will also default the Voicemail, and visa versa.

PART 7. VOICEMAIL PROGRAMMING PROCEDURES

7.1 ACCESSING TUI PROGRAMMING

To access the telephone user administration programming interface the technician must call in to the main system greeting. This will typically be the Day Main Menu. If the "enter your password" prompt is played when dialing the voicemail, escape to the main menu by pressing "*"

While listening to the menu prompting, press "#" followed by 3 zeros. Note that if the "Maximum Caller Entry Digits" field of the [MENU BLOCK](#) has been changed, the number of zeros entered must correspond. For example, if "Maximum Caller Entry Digits" is set to 6, it will require that "#" and 6 zeros be entered.

This will request access to the administration interface. When successful, an "enter your password" prompt will be played. This password is the "System Admin" password set on the [SYSTEM PARAMETERS](#) screen. The default is "0000". Once administration has been accessed, the system will play all of the available options.

To access Subscriber administration press 2 and follow the spoken instructions to create, delete, or edit voicemail subscribers.

7.2 ACCESSING WEB PROGRAMMING

To access Voicemail programming, open Internet Explorer 6.x and in the address bar enter the prefix "https://" followed by the IP address assigned to the OfficeServ 7100 main processor (MP) in MMC 830. This will only work if the PC running Internet Explorer 6.x is on the same LAN as the OfficeServ 7100.

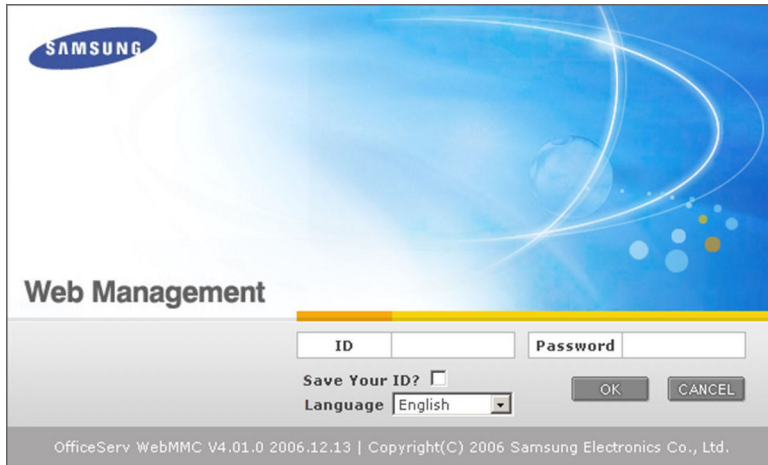

Because the connection is secure a warning will be displayed stating that there is no valid certificate.

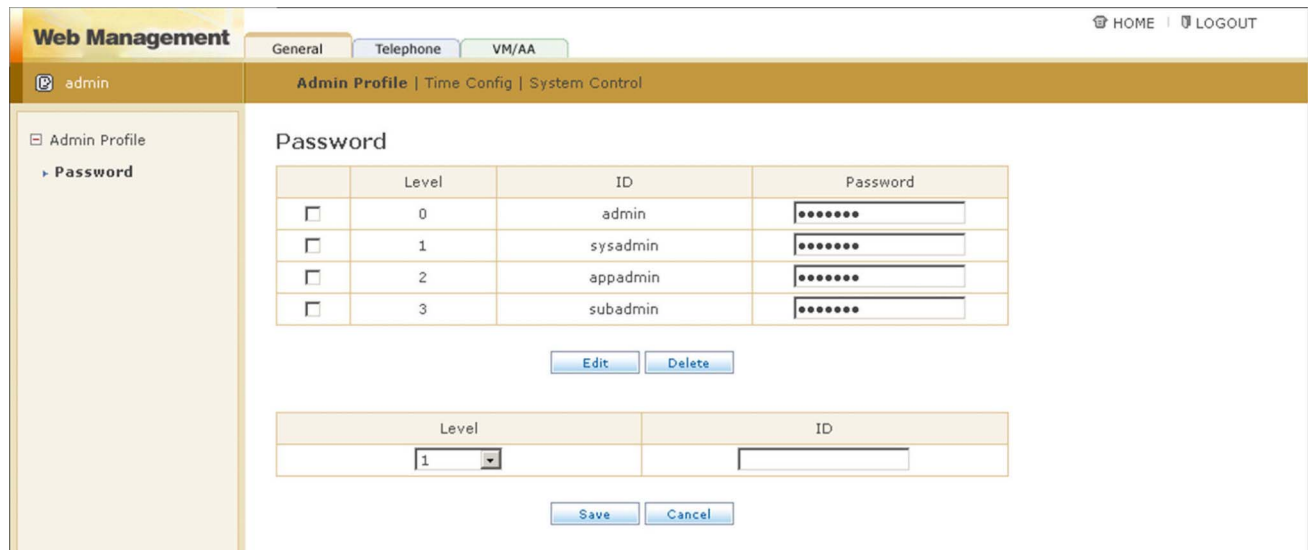

This warning is displayed because the site certificate is not present. Simply click Yes to bypass the screen and load the login page.

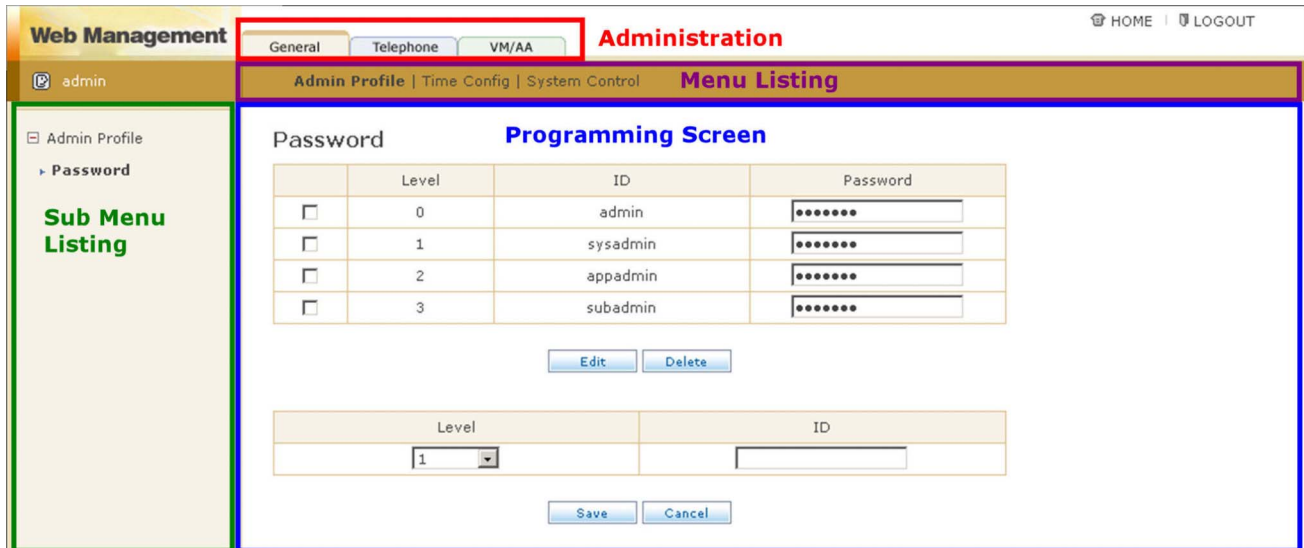

Access to the web interface is controlled by user accounts. The default user account is the Site Administrator. The username for this account is "admin" and the password is "samsung".

After logging in with the Site Administrator account it is possible to change this password. Alternate user accounts can also be created. To create a new user account choose an administration level (1 through 3, explained in Part 3.2 of this manual) and set a username (ID). The default password for new accounts is "samsung". To change a password for any account check the box to the left of that username, modify the Password field, and then click Edit.

The web interface is broken down into several pieces as shown below:

7.2.1 Administration Section

This area is used to switch between the various programming interface tabs. General is accessible only for the Site Administrator account and is used to manage administration accounts as well as system database management. VM/AA is used to program the Voicemail and Automated Attendant programs.

NOTE: The Telephone tab is NOT for use in the USA under any circumstances.

7.2.2 Menu Listing

This area displays the menu options for the selected programming interface.

7.2.3 Sub Menu Listing

This area lists all screens available for the selected menu option.

7.2.4 Programming Screen

The programming screen contains the actual data for the selected menu option or submenu selection.

7.3 PROGRAMMING SCREEN ELEMENTS

Though each programming screen is unique, there are certain common interface elements to be aware of.

7.3.1 Page Navigation Buttons

The page navigation buttons are used in the event that there is too much data to fit into one screen. The numeric list in the center defines the group of pages that is currently being viewed. Simply click one of the numbers to navigate to that page. The First button will jump directly to the first group of pages, namely page 1 through page 5. The Previous button will jump to the group of pages immediately preceding the current group. The Next button will jump to the group of pages immediately succeeding the current group. The Last button will jump directly to the last group of pages.

7.3.2 Voicemail Tenant Group Selection

The voicemail system can be programmed to support multiple tenants for advanced applications. Each tenant in the voicemail is notated by a numeric group number, referred to as the VMS number. The VMS group selection box is used to determine which tenant's block should be viewed for the selected block type.

7.3.3 Block Search

The block search feature is used to quickly find a specific block by name or number when there are many pages of blocks available. The Menu block, for example, may have many pages. The block search allows a user to search for a specific Menu without having to manually look through all of those pages. Simply enter the name of the block and click Search. Certain types of blocks, such as Extension and Mailbox blocks, can also be searched by number instead.

7.3.4 Block List

<input type="checkbox"/>	No.	Label Name
<input type="checkbox"/>	1	Day Main
<input type="checkbox"/>	2	Direct Station
<input type="checkbox"/>	3	Direct Trunk
<input type="checkbox"/>	4	Forward Station
<input type="checkbox"/>	5	Forward Trunk
<input type="checkbox"/>	6	Holiday Main
<input type="checkbox"/>	7	Night Main
<input type="checkbox"/>	8	Record Call
	9	TEMPLATE MNU
<input type="checkbox"/>	10	Transfer to MBX

The block list is used to display all available blocks and also allow users to edit or remove blocks. To edit a block, simply click the Label Name. The checkboxes on the left are used for deleting one or more blocks.

7.3.5 Block Creation and Removal

The block creation and removal buttons are used to create new blocks or delete existing blocks. To delete a block or blocks check the box next to the appropriate blocks and then click Delete. To create a new block simply click Add.

7.3.6 Block Navigation

Sometimes it may be necessary to edit many of the same block type. For instance, after adding a new Mode block it may be necessary to update all Menu blocks to reflect some new setting. The block navigation buttons exist to eliminate the need for a user to constantly reload the block listing to move to another block. Instead the user can use the block navigation keys to directly load the previous block in the block list by clicking Prev, or to move to the next block on the block list by clicking Next.

7.3.7 Block Editing

The block editing buttons are used to perform a variety of actions. The Close button will cancel any changes and exit to the block list. Reload will refresh the current page. Save & Exit will save any changes to the page and exit to the block list. Save will save changes to the block and remain viewing the current page. Copy allows the user to copy the current block to a new block of a different name. Refer will display a list of all other blocks in the system that have pointers set to reference the current block. For example, every Menu block has a pointer that goes to the Bye block. So by selecting Refer in the Bye block, a list of all Menu blocks would be displayed.

Status Screen

DESCRIPTION:

The Status Screen is the default screen that is loaded when logging into the voicemail. It is a read-only screen, displaying various real time statistics about the voicemail.

MAIN SCREEN:

Status Screen

Port	Mode	Active Block	Status
1	Day	Day	Idle
2	Day	Day	Idle
3	Day	Day	Idle
4	Day	Day	Idle

Reporting	11/04/06~11/23/06 5:30PM		
Call To-Date	903	Number of Subscribers	84
Average Calls per Week	329	Total Message Count	0
Directory Accesses	0	Avg Messages/Mailbox	0.0
Times All Ports Busy	0	Disk Space Available	64:23

Field Name	Description
Port	The voicemail port number for the port.
Mode	The current scheduled mode of operation of the port.
Active Block	The current program block, if any, being processed by the port. (Day Main Menu, etc.)
Status	The current call status of each port. (Processing, Idle, etc.)
Reporting	The period of time the system has been recording statistics.
Call To-Date	The total number of calls processed by the system.
Average Calls Per Week	The average number of calls made to the voicemail per week.
Directory Accesses	Number of times the system directory has been consulted.
Times All Ports Busy	Total number of times all voicemail ports have been busy.
Number of Subscribers	Total number of voicemail boxes in the system.
Total Message Count	Total number of voicemail messages in the system.
Avg Messages/Mailbox	The average number of messages per mailbox.
Disk Space Available	The approximate amount of recording time left.

Display User Log

DESCRIPTION:

The OfficeServ 7100 provides several logs that can be useful for both debugging and application development. The Display User Log screen shows subscriber events such as logons, messaging activities, and greeting modifications. Events are logged in an easily readable form, displaying time and date, port used, and subscriber name information on one line and activity information on the next. The User Log can be downloaded by clicking the Down button.

DISPLAY USER LOG SCREEN:

Display Error Log

DESCRIPTION:

The OfficeServ 7100 provides several logs that can be useful for both debugging and application development. The Display Error Log screen shows error and warning information for the voicemail and automated attendant systems. Events are logged in an easily readable form, displaying the error type and time and date information on one line and the actual error listing on the next. The Error Log can be downloaded by clicking the Down button.

DISPLAY ERROR LOG SCREEN:

Activity Log

DESCRIPTION:

The OfficeServ 7100 provides several logs that can be useful for both debugging and application development. The Activity User Log screen shows all activity in the voicemail and automated attendant systems. Due to the extreme technical nature of the Activity Log records, this log is mainly aimed at advanced users. The Activity Log can be downloaded by clicking the Down button.

Operating Utilities

Shutdown VM

DESCRIPTION:

The Shutdown VM screen, as the name implies, is used to exit the voicemail and automated attendant application. This is an important step when shutting down the OfficeServ 7100. Failure to exit the system properly can lead to lost or corrupted messages or programming. To prevent accidental exit, the administrator password must be entered in order to shut down the system.

The main Voice Studio screen is separated into 4 main sections:

The Language Selection box in the upper left used to determine which prompt language listings to display.

Next to that are the prompt Search Options. Prompts can be searched for by prompt number or description (script).

In the upper right corner is the Recording Device selection. This is the phone that will be used to record prompts. Enter the phone number and click Call to start the recording session.

Below these options is the Prompt List. The prompt list displays prompt number, description (script), and recording length. To edit a prompt from this region simply click the prompt number to open the recording screen.

PROMPT RECORDING STUDIO SCREEN:

Prompt Recording Studio(0001)

Field Name	Description
VMC Group	The tenant group this EClass block belongs to
Label Name	The label name for this ECLASS block
Extension Retention	The number of days an Extension block with this EClass can exist before being deleted. Enter 0 to disable.
Wait for entry	Number of seconds to wait for the caller to make a selection
Retries on invalid entry	Number of times to let the caller make an invalid selection
Repeat on no entry	Number of time to repeat the greeting if no entry is made
Other Number	Allow the caller to dial another subscriber
Leave a message	Allow the caller to leave a voicemail message
Hold	Allow the caller to hold for a subscriber
Overhead page	Allow the caller to hold while the user is paged
Other options	Allow the caller to route to other options
Operator	Allow the caller to dial the operator
Escape	Allow the caller to escape to a previous block
Prompt	The prompt to use to alert the caller that this option is available
Digit	The single digit option to use for this option
NoAnsr	Allow this option for callers who reach the No Answer greeting
Busy	Allow this option for callers who reach the Busy greeting
FBusy	Allow this option for callers who reach the Fast Busy greeting
Block	Allow this option for callers who reach the Blocked greeting
Error	Allow this option for callers who reach the Error greeting

Extension

DESCRIPTION:

The OfficeServ 7100 voicemail is programmed with a series of programming object called blocks. The Extension block represents a model of the subscriber's telephone. It governs such things as subscriber password, access telephone numbers, availability schedules, personal greetings, and voicemail options available to callers. Up to 9 personal greetings can be recorded and the user can define which of the 9 recordings are used for the various types of greetings defined on the Additional Information screen.

Field Name	Description
VMS Group	The tenant group this subscriber is a part of
Label Name	The name of this subscriber
Number	The extension number for this subscriber
Mailbox	The mailbox number for this subscriber, if any
Eclass	The EClass block that controls this Extension block
Language	The language to use when this subscriber logs in. A setting of None will use the system's default language
Dial Number	The number to dial to reach this subscriber's extension
Alternate Number	An alternate number to use for this subscriber, such as a cell phone or home phone
Supervision Level	Set the transfer type (blind, partially supervised, or fully supervised)
Subscriber Password	This field is used to default the subscriber password. To do this, enter the word 'Default'
Account code	The account code to use when the subscriber dials a long distance number through their voicemail box
Station	This optional field is used to explicitly define a station

Field Name	Description
	block to use when dialing the Dial Number telephone number
Auto Login	Determines whether the subscriber is prompted for a password when calling their voicemail box
Directory	Determines if the subscriber is included in directory searches. Public is for allowing external callers to see this subscriber in the directory, User is for allowing other subscribers to see this subscriber in the directory.
Retention days remaining (Day)	The number of days this extension can go unused before being deleted

AUTHORIZATION SCREEN:

Extension Block(EXT 201)

General	Authorization	Additional Information	Caller Options Processor	Call Director	Activity
Authorizations					
Blocking allowed	No <input type="button" value="v"/>	Enabled	No <input type="button" value="v"/>		
Call forwarding	No <input type="button" value="v"/>	Enabled	No <input type="button" value="v"/>		
Call screening	No <input type="button" value="v"/>	Enabled	No <input type="button" value="v"/>		
Find me allowed	No <input type="button" value="v"/>	Enabled	No <input type="button" value="v"/>		
Scheduling	No <input type="button" value="v"/>	Intercept	No <input type="button" value="v"/>		
Retrieve public caller allowed			No <input type="button" value="v"/>		
Busy greeting allowed			No <input type="button" value="v"/>		
Alternate location allowed			Yes <input type="button" value="v"/>		
Store phone numbers allowed			Yes <input type="button" value="v"/>		
Extended prompting enabled			Yes <input type="button" value="v"/>		

Field Name	Description
Blocking allowed	Allows this extension to redirect callers who attempt to reach the subscriber
Call forwarding	Allows this extension to forward callers who attempt to reach this subscriber to a different subscriber
Call screening	Allows this subscriber to screen their calls. When enabled callers will be prompted to record their name. The subscriber can then accept, reject, or redirect the caller
Find me allowed	Allows callers to this subscriber to attempt to locate the subscriber at any of their stored telephone numbers
Scheduling	Allows this subscriber to set up an availability schedule
Retrieve public caller allowed	Allows the subscriber to pick up callers who are leaving

Field Name	Description
	a message or holding for the subscriber
Busy greeting allowed	Allows the subscriber to record a greeting that will be played when they are busy
Alternate location allowed	Allows this subscriber to forward all calls to an alternate location, such as a cell phone or home phone
Store phone numbers allowed	Allows this subscriber to set up a stored telephone number list that is used by the 'Find me' feature
Extended prompting enabled	When enabled the voicemail will speak every menu option to the subscriber. When disabled, it will play only the first 3 menu options from each menu

Field Name	Description
Stored Numbers	This list of phone numbers allows the subscriber to quickly change their Alternate Number designation. Also, numbers 1 through 5 are used by the 'Find me' feature when attempting to locate the subscriber

Field Name	Description
No answer	Displays whether or not the subscriber has recorded their No answer greeting
Blocked	Displays whether or not the subscriber has recorded their Blocked calls greeting
Screening	Displays whether or not the subscriber has recorded their Call Screening greeting
Busy	Displays whether or not the subscriber has recorded their Busy greeting
Night	Displays whether or not the subscriber has recorded their Night time greeting
Name recorded	Displays whether or not the subscriber has recorded their name
Password set	Displays whether or not the subscriber has changed their password from the default
Availability Schedule	This area is used to set up a call availability schedule. This schedule will determine when callers are allowed to call the subscriber and when they will be redirected to the Night greeting. Off will disable the schedule for that day and redirect all of the subscriber's calls to the night greeting

List

DESCRIPTION:

The OfficeServ 7100 voicemail is programmed with a series of programming object called blocks. The List block provides an easy method of distributing a voicemail message to multiple subscribers. The List block actually stores the message, but creates a pointer to it in each of the members' voicemail boxes. This saves space because the message is not copied multiple times into multiple mailboxes.

Mailbox

DESCRIPTION:

The OfficeServ 7100 voicemail is programmed with a series of programming object called blocks. The Mailbox block is the actual message storage object for the subscriber. It governs such things as message delivery, message storage, and e-mail delivery options. The Mailbox block also contains a Mailbox Greeting. This greeting is only played if callers are sent to the Mailbox block directly without first connecting to the associated Extension block.

Field Name	Description
VMS Group	The tenant group this mailbox is a part of
Label Name	The name of this mailbox
Number	The mailbox number for this block
Extension	The extension number for this mailbox, if any
MClass	The MClass block that governs this mailbox
Language	The language to use when a subscriber logs in to this mailbox
Announce only mailbox	Sets whether or not this mailbox can accept voicemail messages
Send broadcast MSG allowed	Allows this mailbox to send broadcast messages. Broadcast messages are sent to every subscriber in the system.
Use LIFO message ordering	Determines if messages are played back in chronological (First In, First Out or FIFO) or reverse chronological (Last In, First Out or LIFO) order
New message beep(s)	When enabled, the voicemail will beep before requesting the subscriber password to allow the user to quickly know from a remote location if they have new messages or not. One beep signifies one message, two beeps signifies 2 or more messages.

Field Name	Description
Directory	Determines if the mailbox is included in directory searches. Public is for allowing external callers to see this mailbox in the directory, User is for allowing other subscribers to see this mailbox in the directory.
Subscriber password	This field is used to default the mailbox password. To do this, enter the word 'Default' The mailbox password is overridden by the associated Extension block's password.
Retention days remaining (days)	The number of days this mailbox can go unused before being deleted

AUTHORIZATION SCREEN:

Mailbox Block (MBX 201)

General	Authorization	Alerts	MWI & AutoForward	E-mail Gateway	Call Director	Activity
Authorization						
Forced messages allowed		No <input type="button" value="v"/>				
Workload manager		Yes <input type="button" value="v"/>				
Commitment/Follow up allowed		Yes <input type="button" value="v"/>				
Message grouping allowed		Yes <input type="button" value="v"/>				
Mailbox greeting allowed		Yes <input type="button" value="v"/>				
Message alert control allowed		Yes <input type="button" value="v"/>				
Extended prompting enabled		Yes <input type="button" value="v"/>				
Auto play of new message enabled		Yes <input type="button" value="v"/>				
Auto play of message info enabled		Yes <input type="button" value="v"/>				

Field Name	Description
Forced messages allowed	Allows this subscriber to send Reply Required or Delivery Imperative messages.
Workload manager	Allows the user to group commitments, follow-ups, or tasks (requires Workload manager to be enabled) Allows a subscriber to mark quick memo messages as commitments, follow-ups, or tasks
Commitment/Follow up allowed	Allows a subscriber to mark quick memo messages as commitments, follow-ups, or tasks
Message grouping allowed	Allows the subscriber to group messages for quick playback. Messages may be grouped as reminders, Urgent messages, Callback messages, Private messages, or by Sender.
Mailbox greeting allowed	Allows this mailbox to store a separate greeting. The Extension block greetings will override the mailbox greeting
Message alert control allowed	Allows the subscriber to control their message alert settings
Extended prompting enabled	When enabled the voicemail will speak every menu option available to the subscriber. When disabled, it will play only the first 3 menu options from each menu

Field Name	Description
Auto play of new message enabled	Automatically playback new messages when the subscriber logs in
Auto play of message info enabled	Automatically play Caller ID and time and date information with each message

Open Block Table

Network Mailbox

DESCRIPTION:

The OfficeServ 7100 voicemail is programmed with a series of programming object called blocks. The Network Mailbox block is used to enable Audio Messaging Interchange Specification (AMIS) networking with another voicemail system. AMIS networking allows messages to be transmitted back and forth between two separate voicemail systems, allowing other subscribers in both systems virtually transparent access to the networked subscriber.

Field Name	Description
VMS Group	The tenant group this mailbox is a part of
Label Name	The name of this mailbox
Number	The mailbox number for this block
Extension	The extension number for this mailbox, if any
MClass	The MClass block that governs this mailbox
Language	The language to use when a subscriber logs in to this mailbox
Send broadcast MSG allowed	Allows this mailbox to send broadcast messages. Broadcast messages are sent to every subscriber in the system.
Extended prompting enabled	When enabled the voicemail will speak every menu option available to the subscriber. When disabled, it will play only the first 3 menu options from each menu
Mailbox greeting allowed	Allows this mailbox to store a separate greeting. The Extension block greetings will override the mailbox

Field Name	Description
	greeting
Directory	Determines if the mailbox is included in directory searches. Public is for allowing external callers to see this mailbox in the directory, User is for allowing other subscribers to see this mailbox in the directory.
Password	This field is used to default the mailbox password. To do this, enter the word 'Default' The mailbox password is overridden by the associated Extension block's password.
Retention days remaining	The number of days this mailbox can go unused before being deleted
Delivery Schedule	Enter up to 4 times per day that messages should be transmitted. To deliver all messages immediately enter ASAP

PART 8. VOICEMAIL AND AUTOMATED ATTENDANT APPLICATION DESIGN

8.1 OVERVIEW

Creating an automated attendant or voicemail application in the OfficeServ 7100 is a matter of determining the correct block types to use and linking them together into the necessary order. Callers then route between blocks as necessary to meet the needs of the application.

For example, a customer may need calls answered with a company greeting and be given a single digit option that transfers to a corporate headquarters 800 number. Looking at this application in steps it is known that a Dial block will be needed to transfer to the 800 number. A menu will be needed to speak a main greeting and provide single digit options. To program the application the technician would locate a Menu block to answer the call, set the prompt for that Menu to the correct company greeting, then program a single digit option to go to a Dial block. That Dial block would then be programmed to do a blind transfer to the 800 number.

Applications generally require a good knowledge of block types and capabilities, as well as a knowledge of the general flow of calls through the system. There are many common applications built in to the system from a default configuration. These are discussed in Section 8.1.7. Some sample applications can be found in Section 8.1.8.

In most cases the default applications are sufficient to run a small office. For those situations where more is required the following section will provide some vital information to be used when creating applications.

8.1.1 Template Blocks

Any time a new block is created (with the exception of a Mode block), a template block is referenced. Think of the template block as a master form. It allows the technician to specify certain fields that will be the same across all blocks. One example of this is in the Extension block. When a new Extension block is created, the Dial Number will almost always be the same as the Extension block Number. So the Template Extension block has been set up to automatically copy the Number to the Dial Number field. Another example would be defaulting every Menu block to have a single digit option to transfer to an 800 number.

The Extension, Mailbox, List, and Network Mailbox Template blocks also allow the use of a special variable, a lower case "d". When creating a new block of these types the technician is prompted to enter a corresponding number to reference the block with.

Any field in the Template block that contains a lower case "d" will have that number automatically filled in.

Any time an application is going to require the creation of many blocks that will share certain settings, Template blocks can greatly reduce the time spent programming the application.

8.1.2 Call Codes

When a call is sent to the voicemail and automated attendant system it is tagged with a call code. These call codes are industry standard and are used to identify the type of call being delivered. The Mode block type is used to route calls based upon the call code received. Call codes are listed below.

Call Code	Full Name	Description
TS	Transfer Station	This is a station caller who was transferred in
TT	Transfer Trunk	This is a trunk caller who was transferred in
RC	Record Call	This conversation should be recorded
NS	No-answer Station	This is a station caller who was forwarded on a no-answer
NT	No-answer Trunk	This is a trunk caller who was forwarded on a no-answer
DS	Direct Station	This is a station caller who rang directly in
DT	Direct Trunk	This is a trunk caller who rang directly in
BS	Busy Station	This is a station caller who was forwarded on a busy
BT	Busy Trunk	This is a trunk caller who was forwarded on a busy
AS	Anything Station	This is a station caller who was sent by other means
AT	Anything Trunk	This is a trunk caller who was sent by other means

Knowledge of call codes can be very useful when doing advanced call routing applications. For example a customer may want all internal callers who are forwarded on a busy condition to the voicemail be greeted with a generic busy message and given the option to dial out to remote office personnel.

8.1.3 Call Directors

Several block types (Dial, Directory, EClass, Extension, List, Mailbox, MClass, Menu, Network Mailbox, Query, and Speak) contain a series of controls collectively called a Call Director. The Call Director consists of a series of Event Pointers and is used to route callers based upon certain conditions. For example in an Extension block a caller can be redirected to a different mailbox when selecting the single digit option to leave a message.

The Call Director is really the heart of each block's routing capabilities. It is the control mechanism that defines how and where callers are processed through the system. In short, a Call Director is the method by which blocks are tied together to create an application.

The Call Director is based upon operating mode, which means that Event Pointers can be set to perform different actions based upon time of day. For example, callers might only be able to leave a message at night. If no action is set for a particular operating mode, the settings for the Default operating mode will be used. This greatly eases the programming time for situations where the same action should take place in all modes.

8.1.4 Event Pointers

Different programming blocks are tied together through a mechanism called the Call Director. The core of the Call Director is the Event Pointer. Event Pointers are essentially the conditions that callers are routed by. They tell the system what to do with the caller or the subscriber when a certain condition occurs. Each Call Director uses a different set of Event Processors, but the settings for each are the same. Below is an example of an Event Pointer.

Event	Action	Type	Gp	Target Name
NO-ANSR	<input type="text" value=""/>	<input type="text" value=""/>	<input type="text" value=""/>	<input type="text" value=""/>

Notice that there are 5 columns to set up the Event Pointer. The first column is the name of the Event Pointer, which cannot be changed. The second column is the Action column. This setting defines the type of action that will be used. The available Action types are defined below.

Action	Description
GOTO	This means the Event Pointer will send the caller to another block
TRAN	Translate the Event Pointer to another Event Pointer. This is used to have 2 Event Pointers perform the same action without the need to program two separate pointers.
PASS	Password protect the Event. For example, a Menu might offer an unspoken single digit option to log directly into a salesperson's mailbox. The password protection will prompt anyone who presses that digit to enter a password. If the correct password is not given, the user will be blocked from accessing the mailbox.
FILE(PTR)	This is an advanced option generally reserved for very long lists of menu options. It tells the system to open a file and read the Event Pointer definitions from the file instead of the Call Director.
SRCH	This option is only used in Menu blocks. It is primarily used to allow wildcard entries in a menu. It will search through Extension or Mailbox blocks to find a block whose number matches the Event Pointer number.

The Type column is used to select a block type. It references block types by a 3 character abbreviation as shown below.

Abbreviation	Block Type
BYE	Bye Block

Abbreviation	Block Type
DAL	Dial Block
DIR	Directory Block
ECL	EClass Block
EXT	Extension Block
LST	List Block
MBX	Mailbox Block
MCL	MClass Block
MNU	Menu Block
NMX	Network Mailbox Block
QRY	Query Block
SPK	Speak Block

The Gp column is used to select the tenant group to list blocks for. This will generally be "1", the default tenant group, except in situations where tenant groups have been set up. The last setting for the Event Pointer is the Target Name. This is where the actual block to send the caller to is selected. Clicking the Target Name box will bring up a list of blocks of the selected type and tenant group. Locate the block to use and click it. This will finalize the Event Pointer programming.

Each block that contains a Call Director has a different set of Event Pointers available. Below is a list of all Event Pointers and when they happen.

Event Pointer	Description
ANSWER	This event occurs if the system dials a subscriber and the call is answered.
AUTO-FWD	This event is generated when the Mailbox attempts to forward a message.
BLOCKED	This event is generated when the system dials a subscriber and the subscriber chooses to block the call.
BUSY	This event occurs if the system dials a subscriber and gets a busy signal.
DIRECTORY	This event is generated when a subscriber requests Directory access.
DISK-FULL	This event is generated when a caller attempts to leave a message but there is no disk space available to record the message.
ERROR	This event occurs when there is an error trying to process a caller.
ESCAPE	This event occurs when a caller presses the programmed escape digit.
FAXCALL	This event occurs when a Menu block receives a fax tone from a caller.
FBUSY	This event occurs if the system dials a subscriber and gets a fast busy.
GREET-DTMF	This event is generated if the caller presses a digit during the playback of a greeting.
INVALID	This event is generated if the caller presses an invalid DTMF digit.
MESSAGE	This event is generated if the caller elects to leave a message.
MSG-LEFT	This event occurs when the caller has completed a message recording.
NEXT	This event occurs when the block has finished processing the call and is ready to pass it on to the next block.
NO-ANSR	This event occurs if the system dials a subscriber and the call is not answered.
NO-ENTRY	This event occurs if the caller makes no selection.
NOMSG-LEFT	This event occurs when the caller reaches a Mailbox but does not leave a message.

Event Pointer	Description
OPERATOR	This event is generated when the caller presses the operator assistance digit.
OPTION / OPTIONS	This event occurs when a caller presses the digit to hear more options from a subscriber's Extension.
QUE-FULL	This event is generated when a caller chooses to hold for an Extension, but that Extension's queue is already full.
REMOTE-FWD	This event occurs when an automated attendant caller tries to reach an Extension that has set forwarding to another Extension.
USER-EXIT	This event is generated when a subscriber presses the escape digit to exit their voicemail box.

8.1.5 System Registers

One of the most powerful features of the voicemail and automated attendant system in the OfficeServ 7100 is the System Registers. System Registers are basically global variables that store DTMF or voice data. The Caller ID register, for example, stores the caller ID information for the caller.

Registers can be used to store information about the call, the caller, and entries made by the caller. Register values are stored until either new values are written or the call session ends. Registers are primarily read and written in Menu blocks, though some other blocks can modify certain register values. Registers can also be played back to a caller or a subscriber through the use of special dialing characters.

One example usage of registers is in specialized paging applications. By default when the system pages a subscriber for message notification it sends the subscriber's extension number only. The technician could modify the dialing string to include the parameters listed below.

Below is the list of registers and their usage.

Register	Description
ENTRY	This register is not writeable, but instead is used to buffer the DTMF digits entered by the caller in the current menu.
KEY	The Key register is used to buffer all DTMF entries made by the caller across all blocks. If a specific application requires it, this value can be set to instead only buffer one block at a time.
CID	This register stores the Caller ID information received by the system for the caller.
FID/FWDID	This register stores the phone number of the device that transferred the call to the voicemail or automated attendant. If a DID number rings directly to the automated attendant, the register will contain the DID digits.
TID	This register stores the trunk number the caller is connected on. In the case of internal calls, this register is blank.
PORT	The Port register is read only and stores the extension number of the voicemail or automated attendant port the caller is connected to.
TIME	This register is read only and stores the current system time.

Register	Description
ORBIT	This register is no longer used by the system and can be used as a free variable for applications.
DATE	This register is read only and stores the current system date.
ACCNT	The Account register stores the Long Distance Account code entered in the Account Code field of the Extension block most recently accessed. This register is blank if the caller has not been connected to an Extension block, or if the Extension block's Account Code field is blank.
LANG	This register is used to define the system language currently in use. This register may only store a single digit value, and that value must be defined on the Language screen of the System Parameters menu.
REG1	This register is blank by default and can be used freely for storing data for applications.
REG2	This register is blank by default and can be used freely for storing data for applications.
REG3	This register is blank by default and can be used freely for storing data for applications.
REG4	This register is blank by default and can be used freely for storing data for applications.
NAME	This register is only used with Speak blocks and will speak the name most recently recorded by the Call Screening feature.
EXT	This register is only used with Speak blocks and will speak the Extension number last accessed.
MBX	This register is only used with Speak blocks and will speak the Mailbox number last accessed.
X	This register is read only and is used when dialing out of a Mailbox block for message notification. It stores the Extension number that is associated with this Mailbox. If there is no associated Mailbox block this value is blank.
B	This register is read only and is used when dialing out of a Mailbox block for message notification. It stores the callback phone number entered by the caller for the most recent message. If no callback number was entered this value is blank.
N	This register is read only and is used when dialing out of a Mailbox block for message notification. It stores the number of new messages in the Mailbox block.
S	This register is read only and is used when dialing out of a Mailbox block for message notification. It stores the number of saved messages in the Mailbox block.

8.1.6 Special Dialing Characters

Certain block types will allow the technician to enter a dialing string. The following chart explains the special characters available for entry into these dial strings.

Character(s)	Function
&	The ampersand tells the system to perform a flash-hook
,	The comma inserts a one second pause
\	The backslash inserts a four second pause
T	Capital T tells the system to use DTMF dialing
W	Capital W tells the system to wait for an answer
;	The semicolon tells the system to wait for dial tone

Character(s)	Function
~di	This string tells the system to use in-band dialing (primarily for pager usage)
H	Capital H tells the system to operate the hook switch. If on-hook, it will go off-hook. If off-hook it will go on-hook.

In addition to these standard dialing strings the system can also dial out of any System Register. The following chart shows what string to use to dial which Register value.

Characters	Function
\$K	This will dial the value stored in the Key register
\$X	This will dial the value stored in the Extension Number register
\$C	This will dial the value stored in the Caller ID register
\$F	This will dial the value stored in the Forward ID register
\$T	This will dial the value stored in the Trunk ID register
\$B	This will dial the value stored in the Callback register
\$E	This will dial the value stored in the VM/AA Port Number register
\$N	This will dial the value stored in the Number of New Messages register
\$S	This will dial the value stored in the Number of Saved Messages register
\$A	This will dial the value stored in the Long Distance Account Code register
\$1	This will dial the value stored in register 1
\$2	This will dial the value stored in register 2
\$3	This will dial the value stored in register 3
\$4	This will dial the value stored in register 4

8.1.7 Default Applications

8.1.7.1 Voicemail Messaging

All Extension blocks use a default EClass block, which has been preconfigured to allow callers to leave a message in the Extension's associated Mailbox by making no entry or by pressing 1.

8.1.7.2 Automated Attendant Greeting

The Schedule Table defaults to follow the ring plan schedule in MMC 507. Default Mode blocks have been created that will route calls to the appropriate Menu block according to the operating mode currently in use. Day, Night, Holiday, and Weather menus have been created that will greet the caller with a generic greeting prompt and allows multiple commonly used options.

8.1.7.3 Operator Access

All Menu, Extension, and Mailbox blocks are preconfigured such that a caller who presses zero is transferred to the system operator group.

8.1.7.4 Subscriber Direct Dialing

All Menu, Extension, and Mailbox blocks are preconfigured to allow a caller to dial another Extension at any time to be transferred to that Extension.

8.1.7.5 Subscriber Direct Messaging

The default Automated Attendant Menus have been preconfigured to allow a caller to press 6 plus a subscriber number to go directly to the subscriber's voicemail instead of ringing their phone. For example if a caller dials 6201 they will be immediately connected to Mailbox block 201. Note that these types of transfers will cause the caller to hear the Mailbox block greeting rather than the normal Primary No Answer Greeting played by the Extension block. If no Mailbox Greeting has been recorded a generic prompt will be played announcing the Mailbox number.

8.1.7.6 Subscriber Directory Access

The default Automated Attendant Menus have been set to allow a caller to press 9 to search the company directory. By default the Directory search includes all Extension and Mailbox blocks in the system. Note that subscribers will not appear in the directory until they have recorded a name and entered a directory name in their Extension block.

8.1.8 Sample Applications

The purpose of this section is to show some of the flexibility of the system and teach the technician both the step-by-step methods to implement these features, but also to provide insight into the thought processes to use when planning and implementing applications. It is important to note that the methods used to program the following applications are not the only possible solutions. With a more thorough understanding of the system it is possible to accomplish almost any application multiple ways. The important thing is to write the application in a way that makes sense and can be easily understood when the time comes to modify it. That will depend entirely on the personal preferences and thinking processes of the technician.

8.1.8.1 High Security Passwords

Scenario:

A customer requires that all mailbox passwords be at least 6 digits.

Planning:

Because this is a global request that will apply to all subscribers the setting for this is most likely in System Parameters. Looking in the System Parameters screen we find that there is a setting that says Subscriber PSWD Min Length. It is currently set to zero, which means that there is no minimum length for a subscriber password.

Programming:

On the General screen of System Parameters set Subscriber PSWD Min Length to 6 and click Save.

8.1.8.2 Easy Vacation Greetings

Scenario:

Subscribers have complained that they do not like to rerecord their Primary No Answer greeting every time they go on vacation because they forget to change it back.

Planning:

We know that each Extension block allows up to 9 greetings to be recorded. But only one greeting can be assigned for the Primary No Answer greeting at a time, so at first glance it seems there is no way to do this.

However, looking at the available greeting types we see the following: No Answer, Busy, Blocked, Night, and Screening. No Answer is the default that is played for all call types, but in reality it is designated to play only for callers who were forwarded on a No Answer condition. The reason that it plays for all call conditions in a default state is that Busy greeting allowed, Call Screening, Blocking allowed, and Scheduling are all disabled. These settings are found on the Authorization Screen of the Extension block.

When Busy greeting allowed is set to yes then the Primary No Answer greeting will no longer play when callers are forwarded on a busy condition. Instead the Busy Greeting will be played.

When Call screening is set to yes callers who attempt to reach the subscriber from the automated attendant will hear the Screening Greeting while the system contacts the subscriber to request acceptance or rejection of the caller.

When Scheduling is allowed the subscriber can configure a working schedule for the week. Callers who reach the subscriber's voicemail after hours will hear the Night Greeting instead of the Primary No Answer Greeting.

When Blocking allowed is set to yes callers who attempt to reach the subscriber while the subscriber is unreachable are played the Blocked Greeting instead of the Primary No Answer Greeting.

Keeping the customer's application needs in mind it seems that call blocking may be the right choice. But what constitutes a blocked call? There are two ways a call can be considered blocked. Notice that on the Authorizations Screen there are 2 settings for Blocking. One is to allow call blocking, the other is to enable it. When call blocking is enabled then all calls that attempt to reach the subscriber from the automated attendant will be considered blocked. The other types of calls that arrive as blocked are DND Forward calls.

In MMC 102 (Call Forwarding) there is a setting for DND Forwarding. If this is set to the voicemail group then when this subscriber sets DND on their phone all callers will arrive at the voicemail as blocked calls. If Blocking allowed is set to yes then the Blocked Greeting will be played.

So the easy way for the customer to set a vacation greeting is to record a Blocked greeting in an unused recording number that holds their vacation announcement. Then when they go on vacation they can simply enable DND on their phone and callers will hear their vacation greeting. When they return from vacation they can disable DND and callers will again hear the Primary No Answer Greeting.

Programming:

On the Authorization Screen of the subscribers' Extension blocks set Blocking allowed to Yes and click Save.

Set subscribers' DND forwarding to the voicemail group in MMC 102.

In MMC 722 provide each user a DND key and label it Vacation.

Educate subscribers that in order to enable their vacation greeting they will need to record it by logging in to their mailbox and going to more options (0), then greetings (5), then Blocked Greeting (3). The first time they try to record this greeting they will need to select an unused recording number. 1 is already designated for the Primary No Answer Greeting, so have them use recording number 3.

Educate subscribers that after recording the greeting they will need to press the Vacation button to divert all callers to the vacation greeting.

8.1.8.3 Subscriber “Find-Me”

Scenario:

A customer would like his phone set up so that callers are given the option to attempt to locate him on his wireless extension, remote office phone, cell phone, and home office phone.

Planning:

The customer wants callers to be given the option to find him. We know that the Extension block has a feature called Find me. But how does it work?

On the Authorizations screen of the Extension there are 2 settings for Find me. One is to allow the use of the feature and the other is to actually turn it on (enable it). When it is allowed and enabled callers who reach the Extension block will be asked to hold while the subscriber is located.

On the Additional Information screen there is a list of 9 Stored Numbers. The first 5 of these numbers will be used for the Find me feature. When the system attempts to locate the subscriber it will first attempt to call Stored Number 1, then 2, then 3, and so on. Note that this is a supervised transfer, so if the call is not answered the transfer will pull back and move to the next number. If all 5 calls go unanswered the caller will be sent to the Primary No Answer Greeting to leave a message.

If the subscriber does answer at one of the Stored Numbers the voicemail will announce the caller and ask if the call is accepted or rejected. If accepted the caller will be transferred to the subscriber. If rejected the caller will be sent to the subscriber's Primary No Answer Greeting.

Programming:

On the Authorization screen of the subscriber's Extension block change Find me allowed to Yes.

Also set the Enabled box to the right of it to Yes, then click Save.

On the Additional Information screen set Stored Number 1 to the subscriber's wireless extension.

Set Stored number 2 to the subscriber's remote office phone number.

Set Stored number 3 to the subscriber's cell phone number.

Set Stored number 4 to the subscriber's home office phone number and then click Save.

8.1.8.4 Park Caller and Page Subscriber

Scenario:

A floor manager commonly walks to factory floor and is not near his phone to hear it ringing, so he has requested a way to utilize the switch paging feature to be alerted to new callers holding at his desk.

Planning:

We know that the voicemail has a Park and Page feature, so let's take a look at it and how it works.

The Park and Page feature allows the caller to select a single digit option that will place them on hold and page the subscriber that there is a caller holding. The main setting for this feature are found in the EClass block. That means if we want to enable this feature for only a select subscriber or group of subscribers we will need to create a new EClass.

Park and Page settings are located on the EClass' General and OverHead Page screens. The General screen contains the configuration for System Caller

Options, which is the single digit menu that is enabled when a caller reaches the subscriber's voicemail greeting. So the first step is to decide which call conditions a page is allowed in. The available choices are:

NoAnswer – When the caller gets to the voicemail after ringing the subscriber

Busy – When the caller is forwarded on a busy condition

FBusy – When the automated attendant attempts to transfer a caller to the subscriber but encounters a fast busy

Block – When the subscriber either rejects a screened call or has all calls blocked

Error – When the automated attendant attempts to transfer a caller to the subscriber but encounters an error

Comparing these conditions to our customer's request we will only enable paging on a NoAnsr condition.

To the left of the call conditions is a Digit column. This is the single digit option that the caller will press to initiate the Park and Page feature.

The OverHead Page contains 2 basic sections. The bottom section contains the prompt settings for the various stages of the Park and Page feature. For this example we will leave these prompts at their default values.

The top section contains the actual configuration for the feature. It can further be broken down into 3 sections: Park settings, Page settings, and Instructions settings.

The Park settings contain two fields. Use Remote hold determines if the caller will be held (parked) at the voicemail port or at a remote location (such as a park orbit or a subscriber's station). Remote hold dial determines the string (feature code) to dial to initiate the remote hold. This is set in the FEATURES section of MMC 724, and by default is 11 for remote hold. We want to park the caller at the subscriber's station, so we will be using Remote hold code 11 with a prefix of \$X to insert the Extension number.

The Page settings also contain two fields. Page zone is the page zone to dial after accessing the paging system. It default to 10, which is an all page (page zone * in the phone system). Page access dial determines the string (feature code) to dial to access the paging system. This is set in the FEATURES section of MMC 724, and by default is 55.

Finally, the Instructions settings also have two fields. The Instructions field determines the digit string the subscriber must dial to pick up their call. Repeat Instructions determines how many times the instructions will be repeated before disconnecting from the paging system.

The Instructions field is set to 10\$T by default. This is actually a feature code designation set in the FEATURES section of MMC 724. By default 10 is the Page Pickup feature. This feature is activated by dialing 10 and then a trunk number. So remembering the Special Dialing Characters section we know that \$T will insert the trunk number the caller is currently connected on. So 10\$T will alert the subscriber to dial 10 and the correct trunk number. But since we are going to use remote hold we actually want to pick the caller up from hold at the subscriber's station, which by default is feature code 12. Feature code 12 (Hold Pickup) does not accept trunk numbers, however, it requires Extension numbers, so we will need to change \$T to \$X.

Once the EClass is configured all that is left to do is assign the subscriber's Extension block to use that EClass. So let's get programming!

Programming:

Create a new EClass named ParkNPage.

On the General screen set the NoAnsr option for Overhead page to Y and click Save.

On the OverHead Page screen set Use Remote hold to Yes.

Set Remote hold dial to \$X,11.

Set Page access dial to 55*.

Change the Instructions field to 12\$X and click Save.

Open the subscriber's Extension block.

Click the EClass field and select the ParkNPage block.

Test the application by calling the subscriber, forwarding to voicemail, and pressing 3 to page the subscriber.

8.1.8.5 Park Mobile Phone Message Notification

Scenario:

A customer wants to be called on her cell phone when she gets new messages in her office voicemail box.

Planning:

We know that the Mailbox block offers a feature called Message Alert. This is exactly the application for that feature.

On the Alerts page of the Mailbox block there are 3 settings for Message Alert. Message alert is currently on determines if notification is enabled or not. Alert on urgent messages only determines which type of new messages will cause a notification. Alert phone number is the actual number to call for the notification.

When Message Alert is configured and enabled the subscriber will be called each time the Mailbox stores a new message. If the subscriber does not answer the call, the system will reattempt the call every 15 minutes for up to 3 attempts. If the call is busy the system will reattempt the call every 5 minutes for up to 3 attempts. When the subscriber answers the call the voicemail will prompt them to enter their subscriber password. Once logged in to the voicemail box they have full access to all TUI functionality, including listening to messages.

One very important topic that must be understood before programming this feature is Station blocks. Any time the system tries to make an outgoing call it must locate a corresponding Station block. There are several default Station blocks: On Premise, Off Premise, Centrex Transfer, and Beepers. Each one has a fairly self explanatory function.

The Station block is responsible for generic dialing housekeeping. For example the Off Premise block is set such that for any 7, 10, or 11 digit number it will automatically dial 9 to access a trunk line. This is important to know because it means when setting the Mailbox's Alert phone number we do not need to enter a 9 to dial out, we simply need to enter the subscriber's cell phone number.

In some cases it may be necessary to make changes to the Station block to dial correctly, such as dialing a number other than 9 to access a trunk. For this example we will assume the subscriber's cell phone number is a 10 digit local number so we will leave the default Station configuration as it is.

Programming:

On the Alerts page of the subscriber's Mailbox block set Message alert is currently on to Yes.

Enter the subscriber's cell phone number in the Alert phone number field and click Save.

Test the application by leaving a message in the subscriber's voicemail and listening for the cell phone to ring.

8.1.8.6 Pager Message Notification

Scenario:

A customer wants to be notified on his pager when he receives new voicemail messages for his office phone. He also wants to see how many new messages he has.

Planning:

Pager notification works very much like Message Alert above, but using different dialing strings and a different Station block which must be specifically assigned.

Pager notification settings are found on the MWI & AutoForward screen of the

Mailbox block. Pager notification is enabled determines if notifications will be made or not. Notify on urgent message only determines which type of new messages will trigger a notification. Station is where the Station block is specified. Dial is the actual pager phone number.

The default station block assigned is the Beepers block. Much like the Off Premise block, the Beepers block is already configured to dial 9 to access an outside line. But unlike the Off Premise block, the Beepers block has a suffix string that is dialed.

The default setting for the suffix is `~diW,$K##`. The "`~di`" tells the system to use inband DTMF. This is because the default dialing is out of band, which most pagers cannot interpret. The capital W tells the system to wait for an answer from the pager. The comma says to wait one second after the answer. The "\$K" tells the system to dial the Mailbox number. The "###" ends the call.

Note that some pager companies answer with a nonstandard greeting or beep, so the capital W may not correctly recognize the answer. In these cases it may be necessary to replace the capital W with a series of pauses. A comma will insert a one second pause and a backslash (`\`) will insert a 4 second pause. It may be necessary to make several test calls to find the correct number of pauses to insert. For this example we will assume that the standard suffix is sufficient.

But the customer requires the page to include the number of new messages. From the chart in section 8.1.6 of this manual we know that the sequence to dial the number of new messages is "\$N".

So in the default suffix we will need to add "\$N", but we also need to include a separator character so that the number of new messages is discernable from the Mailbox number. We will use `*` for the separator. This means the suffix should now be `~diW,$K*$N##`.

Programming:

On the MWI & AutoForward screen of the subscriber's Mailbox block set Pager notification is enabled to Yes.

Ensure Station set to Beepers.

Set Dial to the beeper phone number and click Save. Remember that a 9 is not necessary.

On the General screen of the Station block named Beepers change the Suffix field to `~diW,$K*$N##` and click Save

Test the application by leaving a message in the subscriber's voicemail and ensuring the pager is called.

8.1.8.7 Message Distribution

Scenario:

A customer who works in a sales department would like messages left in his mailbox to be deleted from his box and copied to 5 of his coworkers if he is unable to listen to the message within 15 minutes. When one of the 5 listens to the message it should be removed from the other 4 subscribers' mailboxes.

Planning:

We know that the List block can be used to distribute messages to multiple people. We also know that the List box can be set up to remove the message from other Mailboxes when the first user listens to the message. But he has thrown us a loop by saying he only wants messages to be distributed after 15 minutes. This means that we cannot use the List box for his Mailbox because the List always sends to all parties at once. But we can use the Mailbox block's AutoForward settings to send to a List block. This will allow us to meet all of his requirements.

Message AutoForward settings can be found on the MWI & AutoForward screen of the Mailbox block. Enable autoforward determines if message forwarding will occur. Delete after forwarding determines if the message will be deleted from this Mailbox after forwarding. Auto forward delay determines how long to wait before forwarding the message. Note that only new messages will be forwarded, not saved messages. The Mailbox or List block to forward to is set on the Call Director screen. The Event Pointer AUTO-FWD will be set, in this example, to a LST (List) block that we create.

The List block we create will be numbered 9999, though it could be any number not already in use by another Mailbox or List block. In the new List block on the General screen we will set Delete all unheard copies of a message when played by the first user to Yes. On the List Member screen we will set the 5 sales team members' Mailboxes as members.

Programming:

Create a new List block with a number of 9999.

On the General screen of List block 9999 set Delete all unheard copies of a message when played by the first user to Yes and click Save

On the List Member screen click an empty box to bring up a list of Mailboxes and locate the first of the 5 sales team members' Mailbox and click it. This will add it to the member list.

Repeat the above for the other 4 team members and then click Save.

In the main customer's Mailbox go to the MWi & AutoForward screen and set Enable autoforward to yes.

Set Delete after forward to Yes.

Set Autoforward delay to 0 hours, 15 minutes and then click Save.

On the Call Director screen set the AUTO-FWD Event Pointer Type to LST.

Click the Target Name box for the AUTO-FWD Event Pointer and select List block 9999, then click Save.

Test the application by leaving a message in the subscriber's mailbox and waiting 15 minutes for it to be delivered to the other team members' voicemail boxes.

8.1.8.8 Email Message Notification

Scenario:

A customer has requested that he receive all his messages by email rather than having to check his voicemail through his telephone. He has also requested that his messages be delivered to both his work and home email accounts.

Planning:

This scenario is very easy to implement by using the E-Mail Gateway feature of the voicemail. At the outset configuring the E-Mail gateway may seem overwhelming, but it is actually very simple.

There are a few places where settings have to be made for the E-Mail Gateway to function properly. The first thing to do is to determine how many subscribers will need the feature. By default the system is licensed for 5 subscribers to use the feature. A license can be purchased to allow an unlimited number of users. If a license is purchased it will need to be entered in the License Key field of the E-mail Gateway screen of System Parameters.

Once the licensing is taken care of the next thing to do is set up the error reporting email destination. This is done on the E-mail Gateway screen of System Parameters. The error reporting email is only used in the event the system is unable to deliver a subscriber's email message. The system will send an alert to the error destination reporting of any failures. Obviously if the system loses LAN connectivity the error report email cannot be sent either.

The first thing that is required is the IP address or DNS name of the email server to be used. For this example we will use a DNS address (mail.testsystem.com) so that we can explain how to allow DNS entries to be used by the system. In System Parameters there is a DNS screen. This screen is used to tell the system where to find a Domain Name Server. Contact the LAN administrator to get the address of the proper DNS server. Enter this address in the Name Server Add field and click Add, then click Save. The system is now able to look up DNS addresses.

On the E-mail Gateway screen the mail server address is entered into the Host ID field. Port is the SMTP port being used by the mail server, which is typically 25. SMTP user ID and Password are the username and password to use to log in to the mail server with. Domain is the domain name associated with the login. Note that not all email servers will require a login or a domain. In those cases these fields are left blank.

Report is the email address to send the error report to. Note that this can be any valid email address, including a distribution list. Email addresses can be entered in simple (me@home.com) or named ("My Name" <me@home.com>) formats. If the named format is used when the email reaches its destination the From field will display the name (My Name) instead of the address (me@home.com).

Reply To is the email address to be used if the Report user tries to reply to the error message. Generally this is set to a No Reply email account, but it can be set to any valid email address.

TimeZone defines the time zone the system is located in. Daylight Saving determines if this TimeZone follow Daylight Savings Time.

Once the error reporting email destination has been set up it is time to set up an email account used to send emails to subscribers. This is done on the MClass E-mail Gateway screen.

Host ID is the IP address or DNS name of the email server. Note that a DNS name can only be used if the DNS server has been added on the DNS screen of the System Parameters menu.

Port is the SMTP port being used by the server, which is typically 25.

SMTP user ID, Password, and Domain are all used to set up the login to the server if one is required.

Attempts is the number of times the system should try to send the message to the subscriber before sending an error report.

Retry Interval is the number of minutes to wait between attempts.

Adjust message retention and Message retention to use are used to override the MClass' message retention settings for E-Mail Gateway subscribers. To explain further let us look at 2 subscribers: John and Joe. John is using the E-Mail Gateway and Joe is not. Message retention in the MClass is set for 10 days, meaning that a message can only be held for 10 days without being listened to before it is deleted. Adjust message retention has been enabled and Message retention to use has been set to 1. This means that now John's messages are deleted after 1 day of being unheard, while Joe's messages will still exist for 10 days. Generally if message retention is going to be changed for email subscribers it is recommended that a new MClass be created rather than using

the Adjust message retention setting. This is because it is easier to remember who is using what setting if there are separate MClasses.

The adjusted message retention is very useful, because typically E-Mail Gateway subscribers don't want to log in to their phone to delete messages that they have already listened to from their inbox.

Once the email settings in the MClass are finished it is time to set up the subscriber's Mailbox. To enable the E-Mail Gateway for a subscriber open their Mailbox block and go to the E-Mail Gateway screen.

Enable E-Mail Gateway support determines if the subscriber will receive email messages or not.

From specifies the email address to show in the From field when this subscriber leaves a message for another email gateway subscriber. Let's look at 2 subscribers, John and Jack, who have E-Mail Gateway enabled. John has his email address entered in the From field, but Jack does not. When John leaves messages in Jack's mailbox the email Jack gets will show that it is from John. When Jack leaves John a message, however, the email John gets will show that it is from the email address specific in the Reply To field on the System Parameters E-mail Gateway screen.

The next sets of fields are the Deliver MSG and Notify Only sections. Each section has 5 fields. These fields contain email addresses that email notifications will be sent to. Deliver MSG means that the email will contain a WAV file attachment of the voicemail message. Notify Only is just that: it will send a notification, but not the actual voicemail message. Up to 5 email addresses can be entered for each, and may also include distribution list addresses.

Programming:

On the DNS screen of System Parameters enter the IP address of the DNS server (for example 192.168.1.1) in the Name Server Add field, then click Add, then click Save.

On the E-mail Gateway screen of System Parameters enter the mail server DNS name (for example mail.myserver.com) in the Host ID field.

If an SMTP login is required by the server then enter the SMTP User ID and Password for the account.

If the server requires a domain tag, enter the domain in the Domain field.

Enter the email address to send error reports to in the Report field.

Enter the return email address for the error reports in the Reply To field.

Select the proper time zone in the TimeZone box.

Set whether or not Daylight Savings is used, then click Save.

Open the Standard MClass block's E-mail Gateway screen.

Enter the mail server DNS name in the Host ID field.

If an SMTP login is required by the server then enter the SMTP User ID and Password for the account.

If the server requires a domain tag, enter the domain in the Domain field.

Check the Adjust message retention box and click Save.

Open the customer's Mailbox block and go to the E-mail Gateway screen.

Set Enable E-Mail Gateway support to Yes.

Enter the customer's office email address in the From field.

Enter the customer's office email address in the Deliver MSG – 1 field.

Enter the customer's home email address in the Deliver MSG – 2 field and click Save.

Test the application by leaving a message in the customer's voicemail box and verify that he receives an email containing the voicemail message as a WAV file attachment.

8.1.8.9 AMIS Networking

Scenario:

A customer site has a 2 node SPNet network. They have requested that subscribers in the main node be able to forward messages to the voicemail in the remote node.

Planning:

Sharing voicemail messages between disparate voicemail systems is called AMIS networking. The OfficeServ 7100 fully support the AMIS standard through the use of Network Mailboxes.

Setting up the networking between 2 Samsung voicemail systems is a 3 stage process. The first stage is to export the Subscriber List from the remote node. The second stage is to set up the Network Mailbox Template block in the main node with the correct dialing strings for the networking. The third stage is to import the remote node's Subscriber List into the main node.

For this example we will assume both nodes are OfficeServ 7100 systems.

To export the Subscriber List go to the Subscriber screen on the remote node's voicemail. Select the subscribers to export (or check the box in the upper left to select all subscribers) and click Export Subscriber. This will trigger a prompt to

download a text file from the web page. Note that popup blockers might prevent this file from being downloaded without first allowing it.

Once the list is saved the next step is to go to the main node's voicemail and open the Network Mailbox Template block. On the Call Information screen we need to edit the Telephone Number settings. These settings tell the system both its own identity and the identity of the remote voicemail system. Both the Local and Remote fields are broken down into 3 boxes: country code, area code, and telephone number.

Local sets the telephone number used to access this voicemail system. For this example we will say the voicemail group in the main node is 519 and the voicemail group in the remote node is 529. The Local field will contain 519 in the telephone number box while the country and area code boxes are left blank.

Remote will set the telephone number used to access the remote voicemail system. We will enter 529 in the telephone number field and leave the country code and area code boxes blank.

Once the Template is set up we are ready to create all of the network subscribers. To do this open the Operating Utilities menu in the main node and go to the Subscriber Import screen.

Import Text File is the location of the text file downloaded previously.

You can create determines what type of blocks will be created. Because we are setting up networking this should be set to Network Mailbox blocks.

After clicking Submit a window will appear showing the boxes that will be created and asking for verification. When OK is clicked the new Network Mailboxes will be created and a success message will be displayed showing the number of blocks created.

Subscribers can then forward or create messages for the remote subscribers. Note that for this to work over SPNet the DTMF Type in MMC 835 of both nodes must be set to use Inband (RFC2833).

Programming:

In MMC 835 of the remote node set DTMF Type to Inband (RFC2833).

Open the Subscriber menu in the remote node's voicemail.

Check the box in the upper left corner and click Export Subscriber.

Accept the download and save the file to the desktop as Subscriber.TXT.

In MMC 835 of the main node set DTMF Type to Inband (RFC2833).

In the main node's voicemail open the Network Mailbox Template block.

Go to the Call Information screen.

Enter 519 in the 3rd box (telephone number field) of the Local setting.

Enter 529 in the 3rd box (telephone number field) of the Remote setting and click Save.

Go to the Operating Utilities menu and open the Subscriber Import screen.

Click Browse and locate the saved Subscriber.TXT file on the desktop and click OK.

Select the radio button that says Network Mailbox blocks and click Submit.

Verify the correct subscribers are being imported and click OK.

Verify that the success message shows all blocks created successfully.

Test the application by leaving a quick memo in a remote node extension and verify that the message is delivered to the remote node's voicemail.

8.1.8.10 Multilingual Automated Attendant

Scenario:

A customer site needs to support English and Spanish speaking callers in their automated attendant. They want to answer with a company greeting and offer the caller the option to press 2 for Spanish or stay on the line for English.

Planning:

The OfficeServ 7100 automated attendant supports the use of 2 languages simultaneously. These languages are set up on the System Parameters Language screen. Select First Language sets the first set of language prompts to load. Select second language sets the second language to load. By default these are set to English and Spanish respectively.

Default language sets which language will be initially used when a caller is answered. Key Code determines what single digit will represent that language. This Key Code is used when setting up multilingual Menus.

Once the languages are set we need to open the automated attendant main Menu block and set up the language selection. In this example we will use the default Day Main Menu block. The first thing we want to do is copy the existing Day Main Menu to a new block called Day Main 2 because we will be modifying the Day Main Menu so that it is only used to make the decision between English and Spanish.

We then need to record the menu prompt (1001) under the Spanish prompt set. English and Spanish are basically 2 different directories that have files of the same name, but different audio contents. But currently 1001 does not exist in the Spanish directory, so it needs to be created. Do this by going to the Voice Studio menu and clicking Add. Change the language to Spanish and set the

number to 1001, then save &close. This will load the Prompt screen again. Make sure the language is set to Spanish. Enter an extension number in the upper right text box and click call to have the system call to prep for recording. Locate the page with the 1001 prompt and click the number 1001. The system will prompt (in Spanish) through the recording process. Once finished hang up.

We will now go back to the Day Main Menu block to set up the option to select Spanish. In order to activate the Spanish Menu we need to set the Language register to Spanish if the user requests it. We do this by changing the Input Processor Operating Parameters on the General screen of the Day Main Menu. Take INPUT from is set to ENTRY, which means DTMF input from the caller. We need to change Store INPUT in to LANG.

Now change the prompt from 1001 to 1010, which we will record as the "please press 2 for Spanish or stay on the line for English" prompt. Making this change allows us to use 1001 for both the English and Spanish Menu, which simplifies changes in the future.

On the Menu Input Processor we will Clear the following Event Pointers: 5000, *, 6, 8, 0, ???, ?????, ???, and ?????. We will insert new Event Pointers that will point to the correct Menus. Single digits 1 and 2 will go to the Day Main 2 Menu. NO-ENTRY will be set to translate to 1. This means that users can press 1 or remain on the line to get to the English menu.

Programming:

On the Language screen of System Parameters set Select First Language to English, American.

Set Select Second Language to Spanish, Castillian.

Set the Key Code for English to 1.

Set the Key Code for Spanish to 2 and click Save.

Open the Day Main Menu block and click Copy.

Enter the Label Name as Day Main 2 and click Save

Close the Day Main 2 Menu and open the Day Main Menu again.

On the General screen set Store INPUT in to LANG.

Change Prompt 1 from 1001 to 1010 and click Save.

On the Menu Input Processor screen press the Clear button to the right of the 5000 Event Pointer.

On the Menu Input Processor screen press the Clear button to the right of the * Event Pointer.

On the Menu Input Processor screen press the Clear button to the right of the 6 Event Pointer.

On the Menu Input Processor screen press the Clear button to the right of the 9 Event Pointer.

On the Menu Input Processor screen press the Clear button to the right of the 0 Event Pointer.

On the Menu Input Processor screen press the Clear button to the right of the ??? SRCH EXT Event Pointer.

On the Menu Input Processor screen press the Clear button to the right of the ??? SRCH EXT Event Pointer.

On the Menu Input Processor screen press the Clear button to the right of the ??? SRCH MBX Event Pointer.

On the Menu Input Processor screen press the Clear button to the right of the ??? SRCH MBX Event Pointer.

Change the Action for the NO-ENTRY Event Pointer to Tran.

Click the Target name field to the right of the NO-ENTRY Event Pointer.

Type 1 in the text box and click Save.

On a blank Event Pointer line enter a 1 in the Event column.

Set the Action for Event Pointer 1 to Goto.

Set the Type to MNU.

Click Target name and select the Day Main 2 Menu.

On a blank Event Pointer line enter a 2 in the Event column.

Set the Action for Event Pointer 2 to Goto.

Set the Type to MNU.

Click Target name and select the Day Main 2 Menu then click Save.

Open the Voice Studio screen.

Click Add.

Change the Prompt Number to 1001 and the Language to Spanish then click Save & Exit.

Click Add.

Change the Prompt Number to 1010 and the Language to English then click Save & Exit.

Enter an extension number in the upper right text box and click Call and answer the extension when it rings.

Change the language drop down on the Prompt Recording Studio screen from English to Spanish.

Locate prompt No. 1001 and click it.

Follow the Spanish prompt instructions to record and save the Spanish menu prompt.

Open the Prompt screen.

Locate prompt No. 1001 and click it.

Follow the English prompt instructions to record and save the English menu prompt.

Open the Prompt screen.

Locate prompt No. 1010 and click it.

Follow the English prompt instructions to record and save the "Thank you for calling XYZ Company, press 2 for Spanish or hold for English" prompt.

Test the application by making a test call to the automated attendant and verifying the multilingual functions.

8.1.8.11 Multiple Company Greetings Based on Trunk

Scenario:

A customer site has 3 companies utilizing the same system. They would like to have each company's trunks answered with a specialized automated attendant company greeting rather than all callers hearing one generic greeting. They have also requested that each company be allowed a different day and night greeting.

Planning:

Since each company has their own trunk or trunks, we know that that will be the identifying tag to let the automated attendant know which company is calling. But how do we get the automated attendant to look for a specific trunk and take action?

If we look at the System Registers we see a register called TID. This register will hold the trunk number the caller is connected on. So we need to know how to route off that Register. To do that we must look at the flow of a call in this scenario. All trunks are set to ring directly to the automated attendant. According to the Call Code standard that means this is a Direct Trunk (DT) call type.

If we look at any default Mode block we will see that DT calls are sent to a Menu block called Direct Trunk. Looking at the Direct Trunk Menu we see that it is already taking input from the TID register, but there are no Event Pointers built on the Menu Input Processor screen to actually route from, so all DT calls will route to the INVALID Event Pointer, which sends calls to the correct Main Menu for the current Operating Mode.

So what we need to do is create some Event Pointers for each company's trunk(s) to send the calls to the correct company greeting. But to do that we will need to create a Menu block for each company. More specifically we need 2 Menus for each company: one for the Day mode and one for the Night mode. Since we already have a default Day and Night menu, we will only need to create new Menus for the second and third companies.

We will then need to record prompts for each company. For this example we will say that Company A's prompts are 1001 for day and 1002 for night. Company B will use 2001 and 2002, and Company C will use 3001 and 3002.

For this example we will say Company A is using trunks 701 and 702, Company B has 703, 704, and 705, and Company C will use 706 and 707. For simplicity all 3 companies will be using the default Main Menu single digit options, though in practice this is certainly not required.

Programming:

Open the Day Main menu and change the Label Name field to Company A Day then click Save, then Copy.

Enter a Label Name of Company B Day and click Save.

Change the Prompt 1 field to 2001 and click Save, then Copy.

Enter a Label Name of Company C Day and click Save.

Change the Prompt 1 field to 3001 and click Save.

Open the Night Main Menu and change the Label Name field to Company A Night and then click Save, then Copy.

Enter a Label Name of Company B Night and click Save.

Change the Prompt 1 field to 2002 and click Save, then Copy.

Enter a Label Name of Company C Night and click Save.

Change the Prompt 1 field to 3002 and then click Save.

Open the Direct Trunk Menu and go to the Menu Input Processor screen.

Enter a new Event Pointer called 701.

Set the Action to Goto.

Set the Type to MNU.

Click the Target Name field and select the Company A Night Menu.

Enter a new Event Pointer called 702.

Set the Action to Goto.

Set the Type to MNU.

Click the Target Name field and select the Company A Night Menu.

Enter a new Event Pointer called 703.

Set the Action to Goto.

Set the Type to MNU.

Click the Target Name field and select the Company B Night Menu.

Enter a new Event Pointer called 704.

Set the Action to Goto.

Set the Type to MNU.

Click the Target Name field and select the Company B Night Menu.

Enter a new Event Pointer called 705.

Set the Action to Goto.

Set the Type to MNU.

Click the Target Name field and select the Company B Night Menu.

Enter a new Event Pointer called 706.

Set the Action to Goto.

Set the Type to MNU.

Click the Target Name field and select the Company C Night Menu.

Enter a new Event Pointer called 707.

Set the Action to Goto.

Set the Type to MNU.

Click the Target Name field and select the Company C Day Menu then click Save.

Change the Operating Mode to 01 : Day.

Click the Target Name field for the 701 Event Pointer and select the Company A Day Menu.

Click the Target Name field for the 702 Event Pointer and select the Company A Day Menu.

Click the Target Name field for the 703 Event Pointer and select the Company B Day Menu.

Click the Target Name field for the 704 Event Pointer and select the Company B Day Menu.

Click the Target Name field for the 705 Event Pointer and select the Company B Day Menu.

Click the Target Name field for the 706 Event Pointer and select the Company C Day Menu.

Click the Target Name field for the 707 Event Pointer and select the Company C Day Menu then click Save.

Record prompt 1001 with Company A's day greeting.

Record prompt 1002 with Company A's night greeting.

Record prompt 2001 with Company B's day greeting.

Record prompt 2002 with Company B's night greeting.

Record prompt 3001 with Company C's day greeting.

Record prompt 3002 with Company C's night greeting.

Test the application by calling in to each trunk to verify the correct greeting is heard.

8.1.8.12 Delayed Overhead Paging

Scenario:

A certain customer site uses paging frequently, but have noticed that when doing a page from a phone close to other phones there is a great deal of feedback. They have requested some way to perform a page with no feedback.

Planning:

At first glance this seems an odd application to be listed in a voicemail or automated attendant manual.

The reason that paging suffers feedback is that the person sending the page is too close to the paging recipients. So the way to solve that is to record the page and play it after the person recording it has disconnected. The fact that we need a recording tells us that we need to get the voicemail involved.

What we want to have happen is for the person who is doing the page to be able to call in and somehow record a message then disconnect and have the

voicemail dial the page group and speak the recording.

We know that speaking the recording will require a Speak block. We also know that dialing the page group will require a Dial block. But how do we record the message? A Mailbox can't send its' messages to a Speak block, so we seem to be at a dead end.

But if we think back to the section on Registers we might recall seeing a register called NAME. This register holds the name most recently recorded by the Call Screening feature. Call Screening is normally used to request a caller's name so that the subscriber can hear the caller's voice and determine if they will accept or reject the call.

So if we can somehow screen a call the paging party could record their page instead of a name and the NAME register would then contain the page. So the Speak block can indeed speak the page, but we are left with the problem of how to cause a call to an Extension block that is using screening to initiate an action that goes to the Dial block.

We know that if we want to pass activity from one block to another we need to use an Event Pointer so let's look at the Event Pointers for an Extension block. We don't want to have to actually let an extension ring every time we want to do a page, we want it to be quick. So that means NO-ANSR, BUSY, FBUSY, MESSAGE, OPTIONS, and OPERATOR, ESCAPE, NO-ENTRY, INVALID, and QUE-FULL are out because those all happen after the Extension has been tried and comes back to get the Primary No Answer Greeting. That really only leaves BLOCKED and ERROR. The BLOCKED Event Pointer only happens when a Call Screening subscriber answers and then rejects the call or has all calls blocked which would prevent the Call Screening from asking for a name. So really that leaves only ERROR.

But how do we make the call get into an error state? We need it to try and dial an invalid number. The easiest way to do that is to remove the Dial number from the Extension block. That way when it tries to transfer the caller to the Extension there is nothing to dial and it will error.

So the flow is this: the paging party will call in and somehow get to an Extension that had Call Screening enabled, but no Dial number. The paging party will be prompted to record their name, and will instead record their page. The voicemail will place them on hold and attempt to dial the Extension. Since it is blank the call will error. We will set the ERROR Event Pointer to go to the Dial block which will dial the page group and then pass control to the Speak block, which will then speak the NAME register to the paging system.

The problem is that when the Dial block tries to dial the page group the paging party is still on hold for the voicemail port, so the Dial block is going to try and dial into that existing call path. This would mean the page would fail. So we need

the Dial block to alert the caller that they need to hang up. This way the Dial block will create a new call path and dial the page group successfully.

But with all of that set up there's a few housekeeping things to clean up. For starters when they try to get to the Extension that is set for Screening they will hear "Transferring to Extension xxx". Also, once they have recorded their page they will hear "Please hold while I connect your call" before the Dial block is able to tell them to disconnect.

We can remove these prompts, but it would remove them for every other Extension, and that would be bad. So we need to create a new EClass for this one Extension block. That way we can remove the Target herald prompt and the Monitored xfer prompt.

For simplicity we are going to make this paging setup available from the Day Main Menu, though the technician should be aware that any caller who stumbles upon the chosen single digit option will be able to perform a page, so additional actions may be necessary to secure the feature.

Programming:

Create a new Bye block called Silent Goodbye.

Clear the Disconnect Prompt field and click Save.

Create a new Speak block called Announce Page.

Change the Prompt index field to NAME.

Change the NEXT Event Pointer Type to BYE.

Click the Target Name field and select Silent Goodbye and click Save.

Change the Operating MODE to 01:Day.

Press the Clear button for the NEXT Event Pointer and click Save.

Repeat the previous step for each Operating MODE.

Create a new Dial block called Delayed Page.

Change the Prompt field to 1011.

Change the Number field to 55* (or replace * with the proper page zone number out of MMC 604 or 605).

Click the Station Type field and select On Premise and click Save.

Go to the Call Director screen and change the ANSWER Event Pointer Type to SPK.

Click the Target Name field and select the Announce Page block then click Save.

Create a new EClass block called Paging.

On the Prompts screen clear the Target herald prompt field.

Clear the Monitored xfer prompt field.

Change the Call screening prompt to 1010 then click Save.

Create a new Extension block named Page with a Number of 9999.

On the General screen clear the Dial Number field.

Click the EClass field and select the Paging block then click Save.

On the Authorization screen change Blocking allowed to Yes.

Change Call screening to Yes.

Change the field to the right of Call screening to Yes and click Save.

On the Call Director screen change the ERROR Event Pointer Action to Goto.

Change the Type to DAL.

Click the Target Name field and select the Delayed Page block then click Save.

Open the Day Main Menu block and go to the Menu Input Processor screen.

Add an Event Pointer with a single digit 7 (or any unused digit desired).

Change the Action to Goto.

Change the Type to EXT.

Click the Target Name field and select the Page block then click Save.

Record prompt 1010 to say "Please record your page after the beep".

Record prompt 1011 to say "Your page has been recorded, you may now hang up".

Test the application by dialing the voicemail from the subscriber's phone and pressing *7 (or replace 7 with the single digit option chosen above).

8.1.8.13 Emergency Trouble Ticket System

Scenario:

A certain customer site runs a technical support department. The department has an after-hours on-call technician who is responsible for emergency issues. The customer has requested an orderly way for callers to be able to leave messages that give the technician certain key pieces of information (name, callback number, system type, and software version) to be able to assist the caller.

Planning:

The customer has provided a specific list of information that is needed. One way to accomplish this is to make a Mailbox and simply prompt the customer to leave all of this information. However, callers may miss a certain piece of necessary information, so we need a way to "force" the caller to leave their answers. To do that we need a way to ask the caller a question and get a verified response. This sounds like the perfect job for a Query block!

A Query block has a very simple purpose: it asks the caller a question, records the answer, and then either forwards the answer to another Query block or to a Mailbox. The General screen for the Query block has several sections. The Query Script section contains the prompts used to ask the caller the question, as well as the error, invalid, and exit prompts played in response to caller answers.

Script Controls contains various settings that govern the Query. Repeat query and Repeat exit determine if the query or exit prompts are repeated if the caller does not respond. Auto replay determines whether or not to replay the caller's answer to the caller, and Last query determines if this Query block is the last in a chain. A chain of Query blocks is typically called a Question and Answer application.

The Transcription section contains two fields. Header prompt is a prompt that will be played before the customer's answer when the answer is recorded to a message. Mailbox determines the Mailbox block that the answer will be sent to.

The Call Information screen holds digit assignments and caller interface options. Take input from determines whether this Query is looking for a voice or DTMF response. Maximum caller response determines the maximum number of seconds (for voice responses) or digits (for DTMF responses) the caller can record an answer for. Wait for voice response and Wait for DTMF response determine how long to wait before assuming the caller will not answer. The Digit Assignment section contains the single digit options available to the caller when recording their response.

Because we need 4 key pieces of information we will probably want to use 4 Query blocks, each forwarding the response to the next, and the final Query will assemble the responses and send them to a mailbox. We will use 6001 through 6004 for Query prompts and 6005 through 6008 for Header prompts. Prompt 6000 will be used to provide a special Goodbye message to the caller.

But from there we need to make sure the on-call technician receives the information, so we will need that Mailbox to call the technician's cell phone once it receives the message.

Programming:

Create a new Mailbox block with a number of 9998 and a Label Name of Query Result.

On the Alerts screen change Message alert is currently on to Yes.

In Alert phone number enter the technician's cell phone number and then click Save.

Create a new Bye block with a Label Name of After Hours.

Change the Disconnect Prompt field to 6000 then click Save.

Create a new Query block with a Label Name of SW Version.

Enter 6004 in the Query prompt field.

Change Last query to Yes.

Enter 6008 in the Header prompt field,

Click the Mailbox field and choose the Query Result Mailbox, then click Save.

On the Call Director screen change the Type field for the NEXT Event Pointer to BYE.

Click the Target Name field and choose the After Hours block, then click Save.

Create a new Query block with a Label Name of System Type.

Change the Query prompt field to 6003.

Change the Header prompt field to 6007 and click Save.

On the Call Director screen change the Type field for the NEXT Event Pointer to QRY.

Click the Target Name field and choose the SW Version block, then click Save.

Create a new Query block with a Label Name of Callback Number.

Change the Query prompt field to 6002.

Change the Header prompt field to 6006 and click Save.

On the Call Information screen change Take input from to ENTRY then click Save.

On the Call Director screen change the Type field for the NEXT Event Pointer to QRY.

Click the Target Name field and choose the System Type block, then click Save.

Create a new Query block with a Label Name of Caller Name.

Change the Query prompt field to 6001.

Change the Header prompt field to 6005 and click Save.

On the Call Director screen change the Type field for the NEXT Event Pointer to QRY.

Click the Target Name field and choose the Callback Number block, then click Save.

Open the Night Main Menu block and go to the Menu Input Processor page.

Add a single digit Event Pointer of 7.

Change the Action to Goto.

Change the Type to QRY.

Click the Target Name field and select the Caller Name block then click Save.

Re-record the night prompt (1001) to alert the caller of the option to press 7 for emergency support requests.

Record prompt 6000 to say "Thank you, a technician will contact you as soon as possible".

Record prompt 6001 to say "Please tell us your name".

Record prompt 6002 to say "Please enter your callback number".

Record prompt 6003 to say "What type of system are you using?".

Record prompt 6004 to say "What is the software version?".

Record prompt 6005 to say "The caller's name is".

Record prompt 6006 to say "The callback number is".

Record prompt 6007 to say "The system type is".

Record prompt 6008 to say "The software version is".

Test the application by calling in after hours and pressing single digit option 7.
